

service personnel turned the manual-retract handle on the HDR device and successfully returned the source to the tungsten shield.

Preliminary data suggest that the restrictions on the movement of the source wire occurred internally within the HDR, caused by buildup of material within one of the components along the source wire path. Specifically, in two cases, service personnel reported the presence of compacted black dust in the source guide fixtures near the source drive. None of the incidents occurred during patient treatment; however, the possibility of this happening in the future cannot be ruled out.

DISCUSSION

All of the incidents occurred because of an accumulation of dust buildup in the source wire path. It has been determined that the buildup is composed of dust materials produced from normal wear within the device. Analysis of the dust particles has shown that the dust is composed of the same material as the nickel titanium source wire. However, an analysis of the affected source wires, conducted by visual and mechanical examination, has shown that the integrity of the wires was not compromised in any of these events.

This information notice reminds licensees to be aware of the potential problem associated with the accumulation of dust in these devices, leading to source wire constrictions. As a result of the problems caused by the buildup, Varian implemented special maintenance procedures, including the routine cleaning of any components exhibiting dust buildup on a regular basis. Initially, Varian service personnel conducted this cleaning at every source exchange; as the buildup rate of dust has become known, Varian has increased the frequency accordingly.

Varian has released information regarding these events to its customers in Customer Technical Bulletin CTB-VS-640A. The bulletin reminds customers to review their emergency procedures in the event that the source wire must be retracted using the manual-retract handle. The bulletin also asks that customers immediately report any errors that occur upon active wire retraction with error code 1A, class 2, "Active wire drive slippage..." which may indicate that the HDR is trending toward an internal path constriction.

Furthermore, licensees should be aware of the following:

- A user-resettable error code of 1A, class 2, "Active wire slippage..." should be reported to the manufacturer, Varian, immediately.
- To shield the source, personnel would need to implement emergency procedures, which may require turning the manual-retract handle.
- The VariSource HDR is approved for use with an 11-curie iridium-192 source. With such a source the exposure rate is 20.7 rem per hour at 50 centimeters. The exposure rate from an unshielded 10-curie iridium-192 source is 18.8 rem per hour at 50 centimeters (as referenced in the Varian VS2000 SSD).
- After an event where the source has become stuck outside of the afterloader, patient treatments should not resume until repairs are complete.
