

Pulpwood Production In The North-Central Region, 1991

Ronald L. Hackett and Ronald J. Piva

NOTE: This report includes all primary products made from reconstituted wood fiber. In addition to wood pulp, this includes particleboard products¹ made from chips, shavings, wafers, flakes, strands, and sawdust. This report presents the production by county of the raw fiber material delivered to mills. Thus, these data report only that portion of the timber harvest used as raw material and do not necessarily reflect the volume of growing stock harvested.

Pulpwood constitutes more than half the industrial timber products harvested annually in the Lake States (Michigan, Minnesota, and Wisconsin) and is an important product in the Central States (Illinois, Indiana, Iowa, and Missouri).

Current detailed information about pulpwood production² is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, forest industry development, and scientific studies.

Since 1979, we have included logs, bolts, and wood residue used in manufacturing flake board, wafer board, oriented strand board, and medium density fiberboard in this annual report. Together, these products are called particleboards, and all mills manufacturing these boards will be called particleboard mills

in this paper. Wood used at particleboard mills is identical or nearly identical to wood used at pulp mills; therefore, including this wood in our study provides a more accurate estimate of demand for pulpwood-like material.

Particleboard mills were in their infancy before 1979 and used primarily aspen and wood residue. Therefore, data for these mills do not distort roundwood use trends for other species or preclude comparing 1991 survey results with those of 1978 and previous years.

Pulp and particleboard mills using North Central States timber in 1991 reported their pulpwood receipts³ by species group and county of origin. This report presents the results of the survey, analyzes the data, compares results with those of 1991 or earlier years, and discusses trends in pulpwood production and use.

The Lake States and Central States are discussed separately because the timber types in each area are different, the flow of wood between the areas is nominal, and more detailed data on pulpwood production and receipts in the Central States might reveal the operations of individual mills. This is the 33rd annual report of the pulpwood harvest in Lake States counties and the 32nd annual report of the Central States harvest.

Ronald L. Hackett, Research Forester, received a B.S. degree in forest resources from the University of Minnesota. He joined the Forest Service in December 1974, and has been working with the North Central Station's Forest Inventory and Analysis Unit since.

Ronald J. Piva, Forester, received a B.S. degree in forest management from the University of Missouri-Columbia. He joined the Forest Service in 1989, and has been working with the North Central Station's Forest Inventory and Analysis Unit since.

¹U.S. Forest Products Laboratory, 1974. Wood handbook: wood as an engineering material. Agric. Handb. 72. Washington, DC: U.S. Department of Agriculture, Forest Service: 23-27. (Revised)

²Pulpwood production, determined from mill receipts, is the annual volume of pulpwood cut, plus the annual wood residue volume produced by sawmills, veneer mills, etc. used for pulp, particleboard, wafer board, oriented strand board, or medium density fiberboard.

³Pulpwood receipts are the volume of wood received by mills in a specific State or region, regardless of the geographic source.

Several mills purchase their pulpwood based on weight rather than volume. Conversion factors used in the Lake States to convert green tons of pulpwood to standard cord equivalents are shown in the Appendix. Conversion factors used in the Central States are shown in footnote 1 of table 4.

Pulpwood production in Minnesota is completely and accurately shown. However, to prevent disclosure of confidential information about softwood pulpwood use by individual companies, the total quantity of softwood pulpwood imports and exports between Minnesota and Canada is not reported. Thus, some Minnesota softwood shipped to Canada is shown as remaining and used in Minnesota, and receipts of Canadian softwood in Minnesota are understated.

LAKE STATES

Production

- Pulpwood production as a whole increased to 8.6 million cords⁴ in 1991 from 8.4 million cords in 1990, a rise of 2 percent (table 1). Of each cord produced, 92 percent came from roundwood (including chips from roundwood) and 8 percent came from residue⁵ from wood-using plants (fig. 1).
- Principal species harvested were aspen (3.9 million cords), jack pine (722 thousand cords), hard maple (554 thousand cords), and soft maple (474 thousand cords). Other major species furnishing more than 300 thousand cords were balsam fir, red pine, and white birch.
- Hardwoods constituted 76 percent of the total pulpwood production. Pulpwood from hardwood residue increased 83 thousand cords (20 percent) from last year's 417 thousand cords.

⁴All references to cords are in standard cords. A standard cord is 128 cubic feet of wood, bark, and air space.

⁵Residue is the byproduct from sawmills, veneer mills, cooperage mills, and other wood-using mills that is used for pulping and particleboard. Residue includes slabs, edgings, veneer cores, sawdust, woodflour, and chips manufactured from slabs, edgings, and veneer cores.

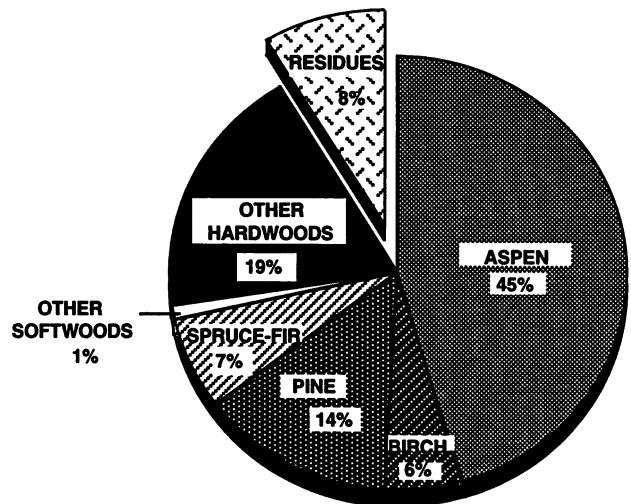

Figure 1.—Lake States pulpwood production by species group, 1991.

- Aspen remained the dominant pulpwood harvested—49 percent of the total.
- Softwood roundwood production reached a new high of 1.88 million cords. Pulpwood production from softwood residue increased to 200 thousand cords, an increase of 26 percent from last year. Increases in jack pine (722 thousand cords), red pine (405 thousand cords), spruce (237 thousand cords), and balsam fir (364 thousand cords) pulpwood production offset losses in cedar, hemlock, and tamarack (fig. 2).
- Whole-tree-chip⁶ (WTC) production, which makes up 6 percent of the total pulpwood production in the Lake States, dropped 1 percent to 512 thousand cords. Aspen WTC production increased 7 thousand cords or 3 percent between 1990 and 1991 (fig. 3). Softwood WTC production increased 10 thousand cords between 1990 and 1991. WTC production in other hardwoods (balsam poplar, maple, ash, and oak) declined 23 thousand cords to 211 thousand cords.

⁶Pulpwood produced from chipping entire trees (all portions of the trees above ground, except the stumps).

1/ Vertical columns of figures under the box heading "Production by States" present the amount of pulpwood cut in each State.

2/ Mostly Western States.

3/ Pulpwood shipped to mills outside of region.

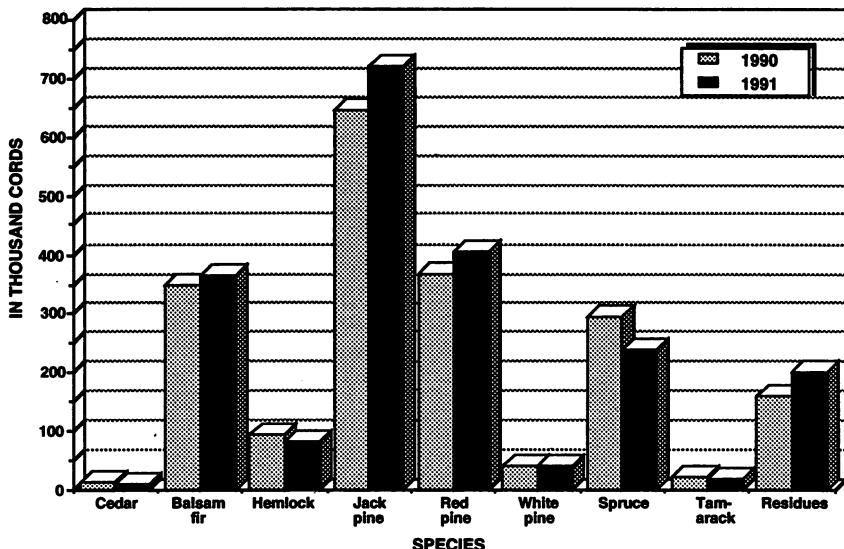

Figure 2.—Softwood pulpwood production in the Lake States, 1990-1991.

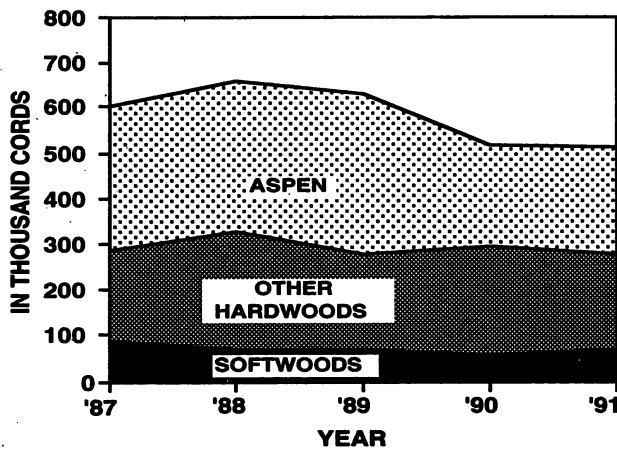

Figure 3.—Whole-tree-chip production in the Lake States, 1987-1991.

- Michigan is the major producer of whole-tree-chips in the Lake States with 391 thousand cords (76 percent). Loggers in the Northern Lower Peninsula of Michigan harvested 257 thousand cords (50 percent) of WTC production (fig. 4).

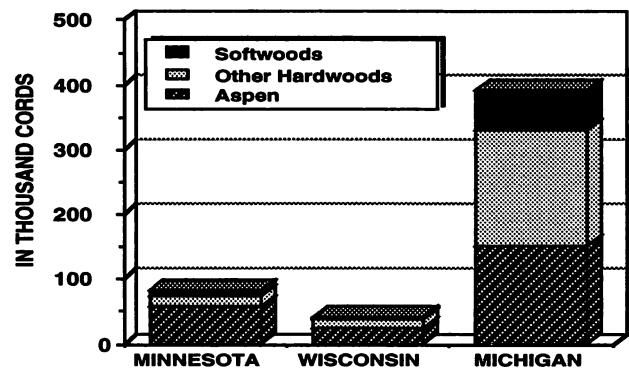

Figure 4.—WTC production by State in the Lake States, 1991.

- Jack pine was the predominant softwood species used in WTC in 1991, making up 74 percent of the softwood WTC production and 10 percent of the total WTC production.

Michigan

- Rebounding from a decline in pulpwood production in 1990, Michigan pulpwood production increased 1 percent to 3.0 million cords in 1991 (fig. 5). Increases in balsam fir, pine, and hard and soft maple production offset the declines in aspen, birch, and residue production.

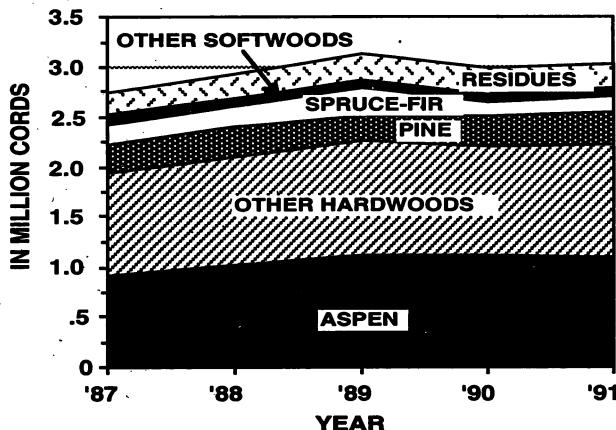

Figure 5.—Michigan pulpwood production by species group and residues, 1987-1991.

- The Western Upper Peninsula was the top producing region in Michigan with 38 percent of the roundwood harvested (fig. 6). Aspen, along with balsam poplar, white birch, hard maple, and soft maple accounted for nearly 75 percent of the pulpwood harvested in the Western Upper Peninsula and 28 percent of the pulpwood harvested in the State. Aspen pulpwood production declined 2 percent over last year's 1,115 thousand cords. More aspen pulpwood was harvested from the Northern Lower Peninsula than from any other Survey Unit in the State. The 515 thousand cords of aspen harvested from this unit represented more than half of the unit's total pulpwood production and a fifth of the State's total pulpwood production.
- Marquette County in the Western Upper Peninsula was the top producer in the State with 306 thousand cords. The second largest producer of pulpwood was Delta County with 162 thousand cords, a 28-percent decrease from last year's harvest of

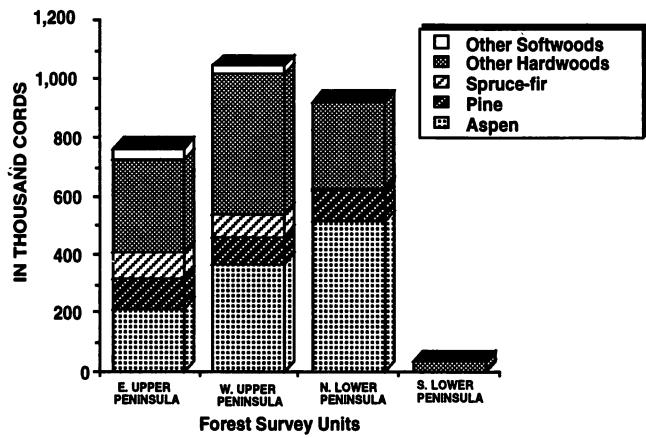

Figure 6.—Michigan pulpwood production by Forest Survey Unit and species groups, 1991.

225 thousand cords. Other counties that produced 100 thousand cords or more were Alger, Menominee, Schoolcraft, Dickinson, Houghton, Iron, and Ontonagon.

Minnesota

- Pulpwood production including residues increased 1 percent to 2.39 million cords in 1991 (fig. 7).
- The Northern Pine Unit remains the top pulpwood producing area in Minnesota with 1.2 million cords (fig. 8). Aspen pulpwood harvests accounted for nearly 80 percent of the Northern Pine Unit's pulpwood production and more than 40 percent of the entire State's pulpwood production.

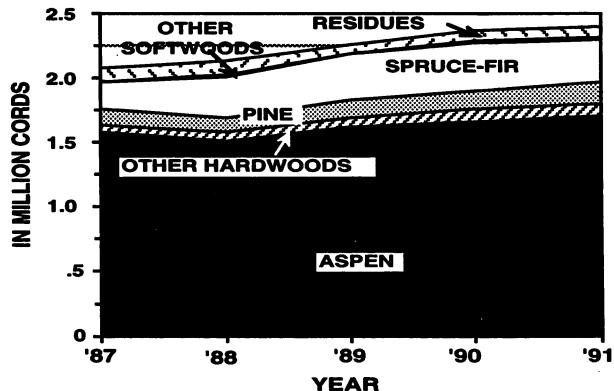

Figure 7.—Minnesota pulpwood production by species group and residues, 1987-1991.

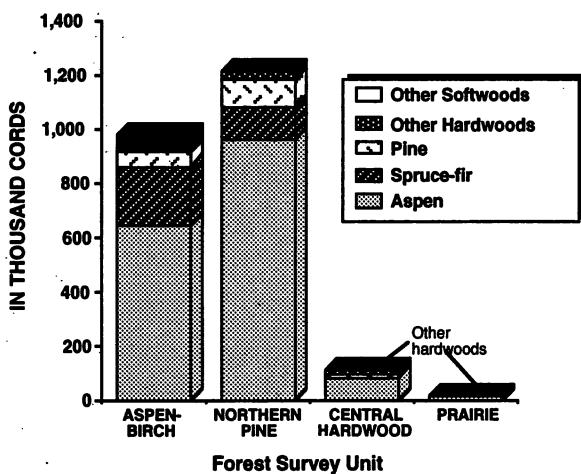

Figure 8.—Minnesota pulpwood production by Forest Survey Unit and species group, 1991.

- Aspen pulpwood production increased to a new high of 1.7 million cords, a 5-percent increase over last year.
- Softwood roundwood production declined 4 percent or 18 thousand cords from last year. Spruce production decreased 28 percent or 39 thousand cords. Jack pine pulpwood harvests increased nearly 25 percent over last year's 114 thousand cords. Red pine production increased 5 percent from 19 thousand cords to 20 thousand cords.
- St. Louis County, in the Aspen-Birch Unit, remains the top producing county with 495 thousand cords, a 3-percent decrease from last year. Itasca County is the second largest producer of pulpwood in the State with 364 thousand cords, a 4-percent drop from last year's total of 380 thousand cords. Other counties producing more than 100 thousand cords were Koochiching, Beltrami, and Cass.

Wisconsin

- Pulpwood production in Wisconsin increased 2 percent to 3.14 million in 1991. The increased production came mainly from increased use of hardwood residues (fig. 9).

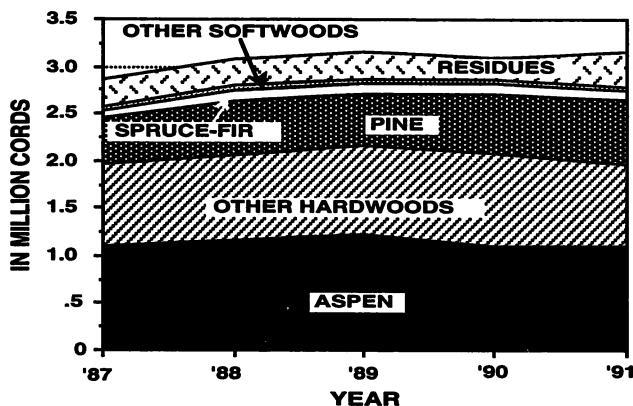

Figure 9.—Wisconsin pulpwood production by species group and residues, 1987-1991.

- Aspen harvest dropped 1 percent from 1,090 thousand cords in 1990. Other hardwoods (hard maple, soft maple, white birch, ash, basswood, elm, and yellow birch) accounted for 28 percent of the State's pulpwood production in 1991.
- Pine pulpwood production in Wisconsin accounted for 25 percent of the total harvest. Jack pine was the major softwood species harvested with 42 percent of all softwood production.
- The Northwest and Northeast Survey Units were the top pulpwood producing areas in Wisconsin with 39 percent and 38 percent of total pulpwood production respectively (fig. 10). The Central Unit was the largest producer of pine pulpwood with 40 percent of all pine harvested in the State.

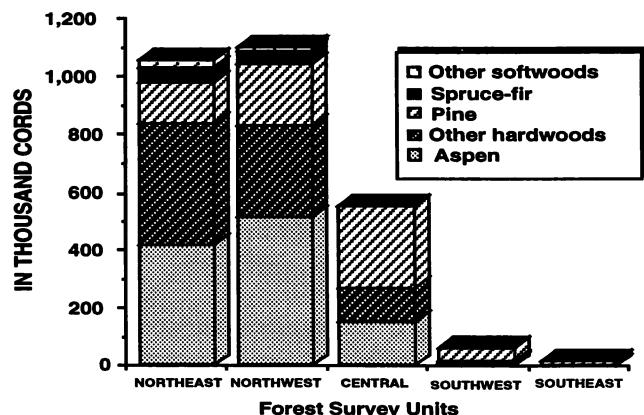

Figure 10.—Wisconsin pulpwood production by Forest Survey Unit and species group, 1991.

- Bayfield County in the Northwest Unit was the top pulpwood producing county in the State in 1991 with 193 thousand cords, a 13-percent increase in harvest from 1990. The second largest pulpwood producing county was Oneida with 179 thousand cords, a 1-percent decrease over 1990. Other top-producing counties with 100 thousand cords or more were Marinette, Sawyer, Forest, Langlade, Lincoln, Ashland, Douglas, Iron, Price, and Vilas.

- In this report, we show the distribution of the harvest in two ways: first, the amount of pulpwood cut relative to the growing-stock volume in each of five major pulpwood species (fig. 11); and, second, the amount of pulpwood relative to commercial timberland area (fig. 12).

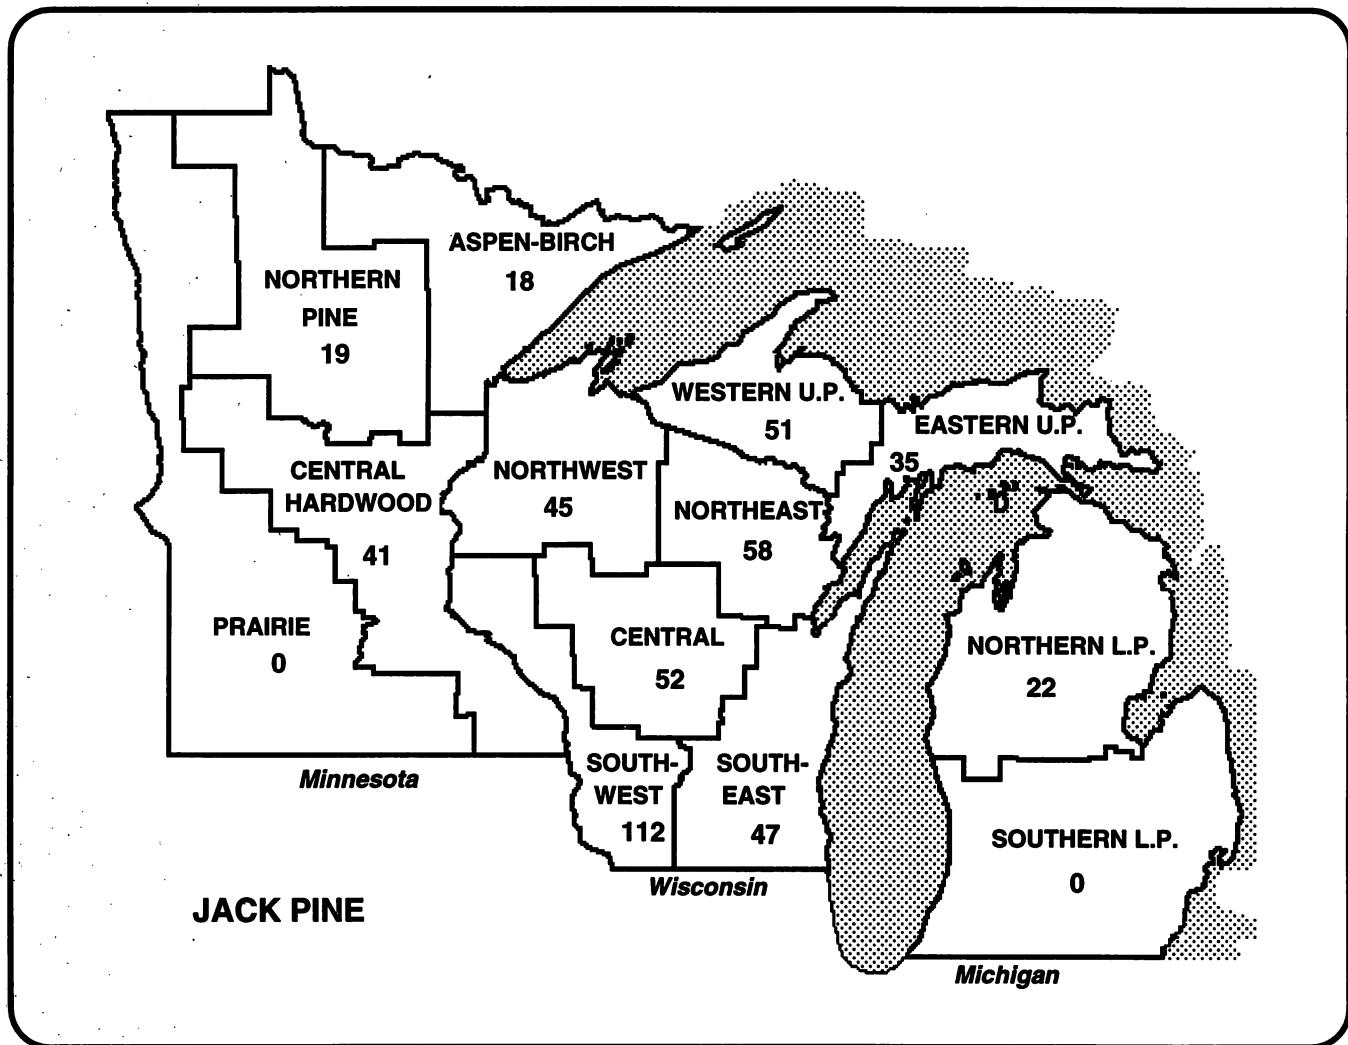

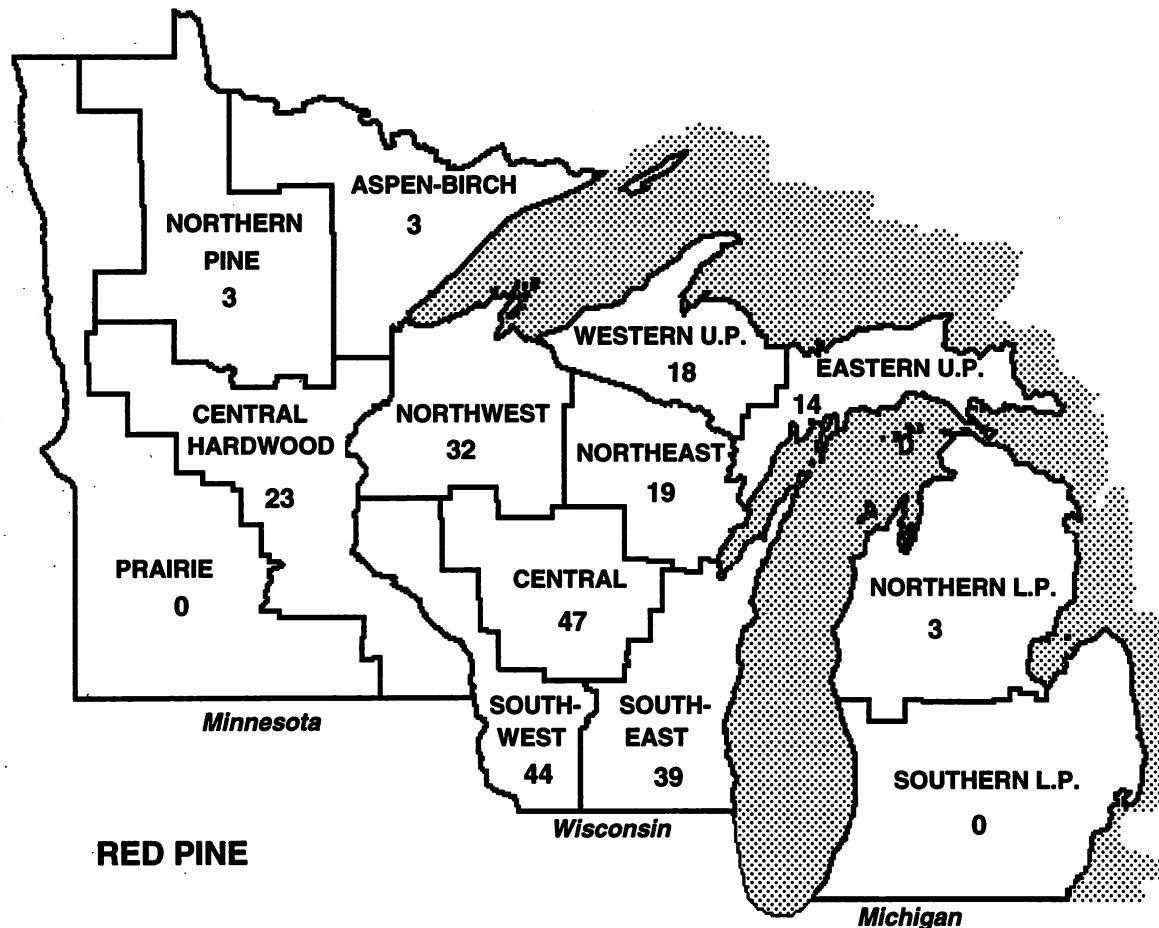

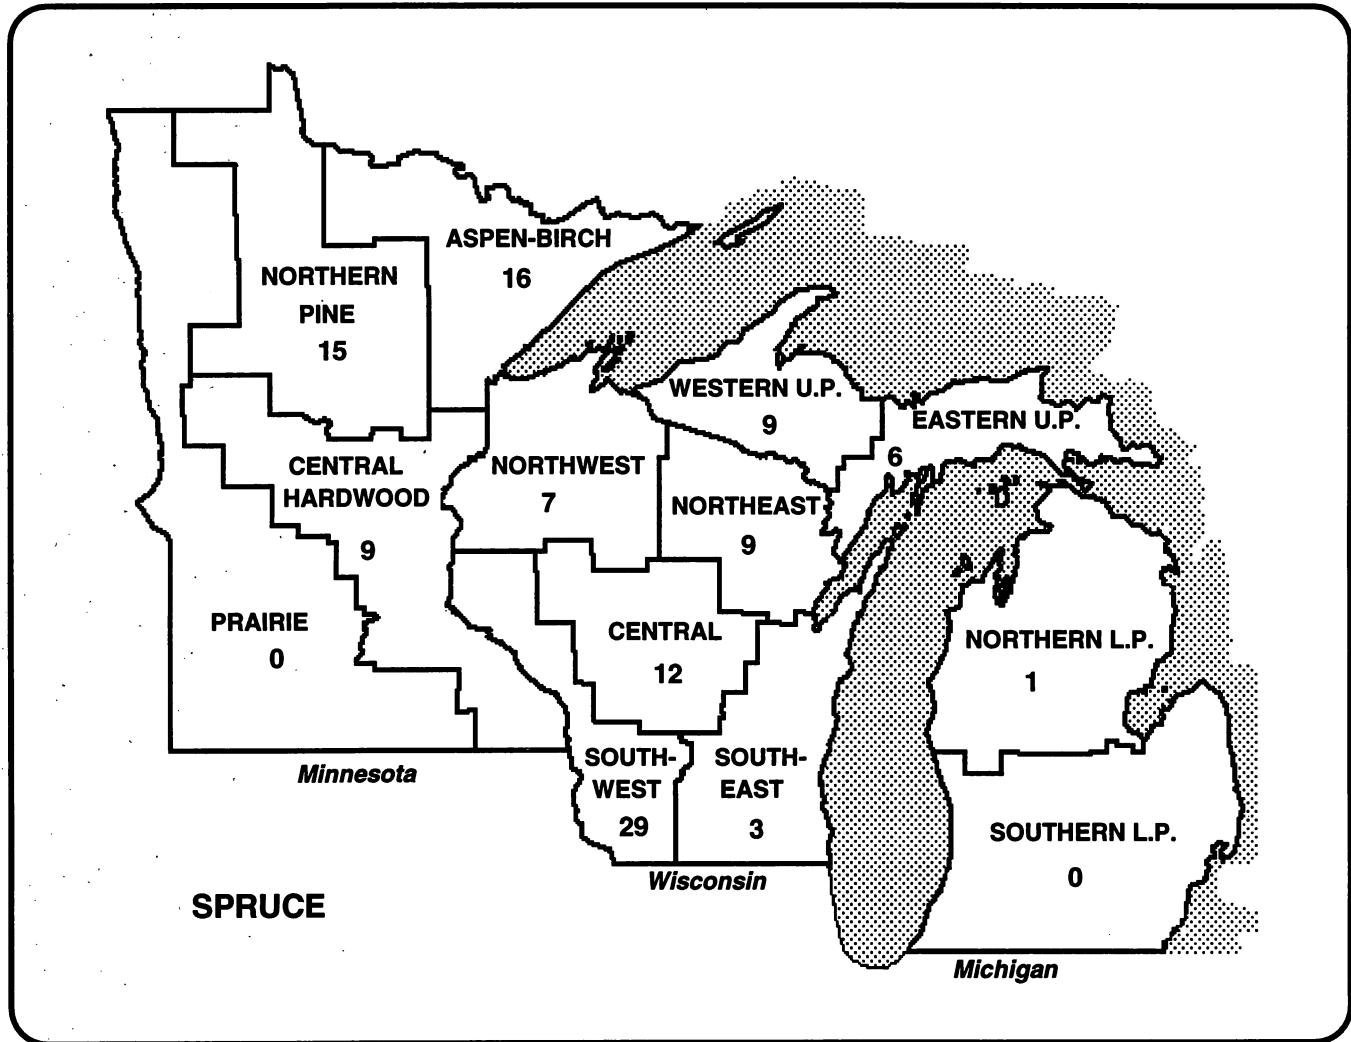

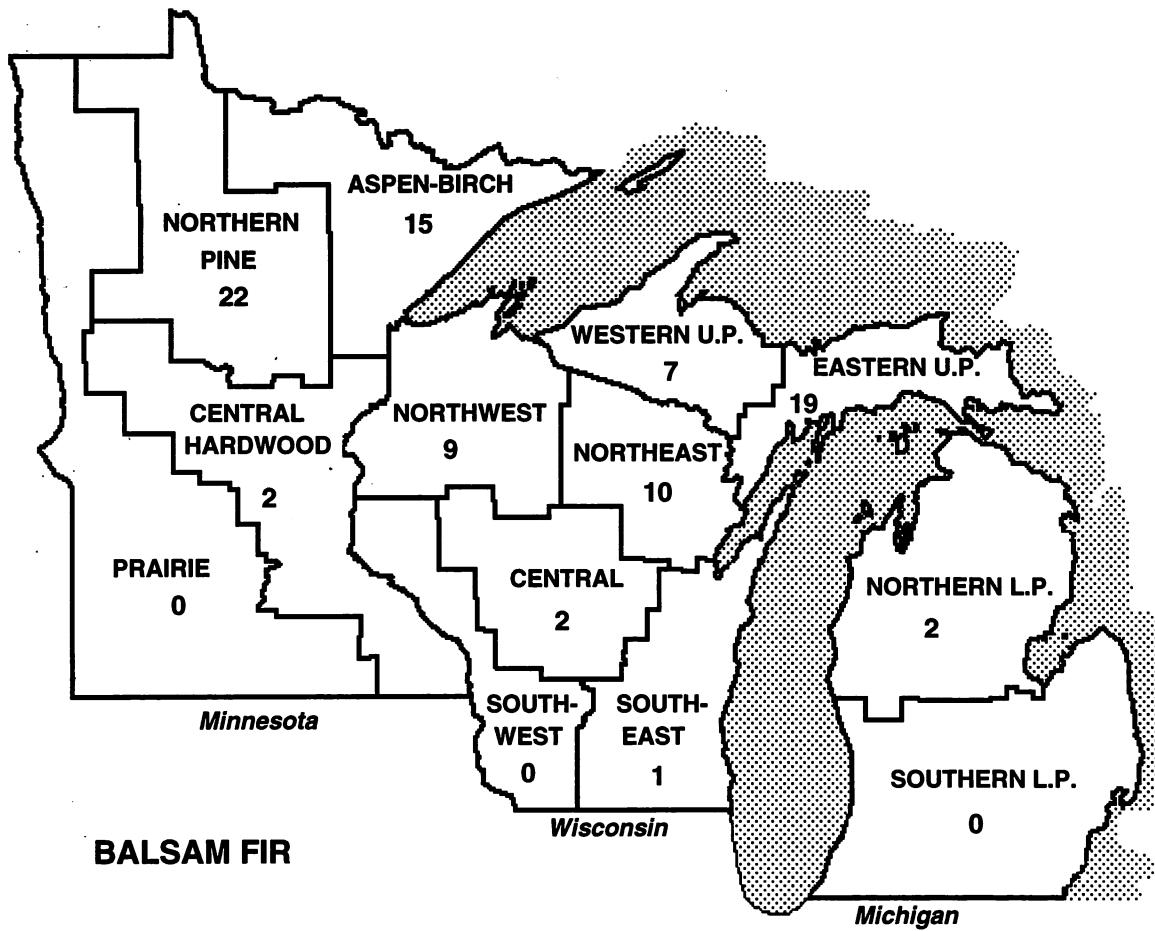

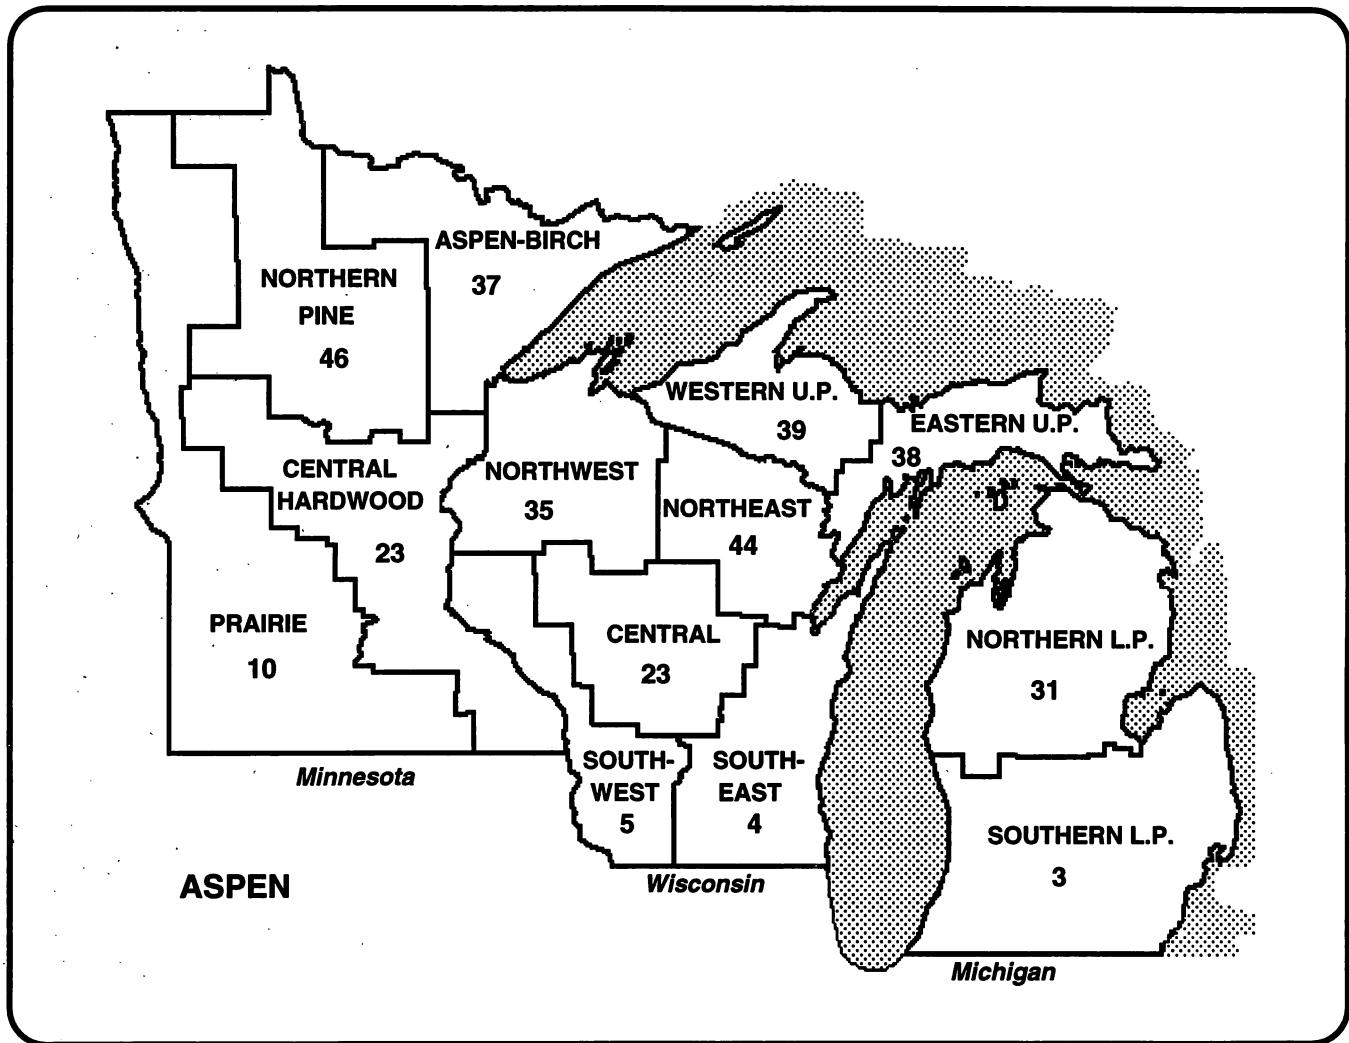

Figure 11.—Cords of roundwood pulpwood (including chips from roundwood) harvested per 1,000 cords of growing-stock volume for each of five principal pulpwood species by Forest Survey Unit, 1991. Growing-stock volume was determined during the last forest inventory in each State.

LAKE STATES

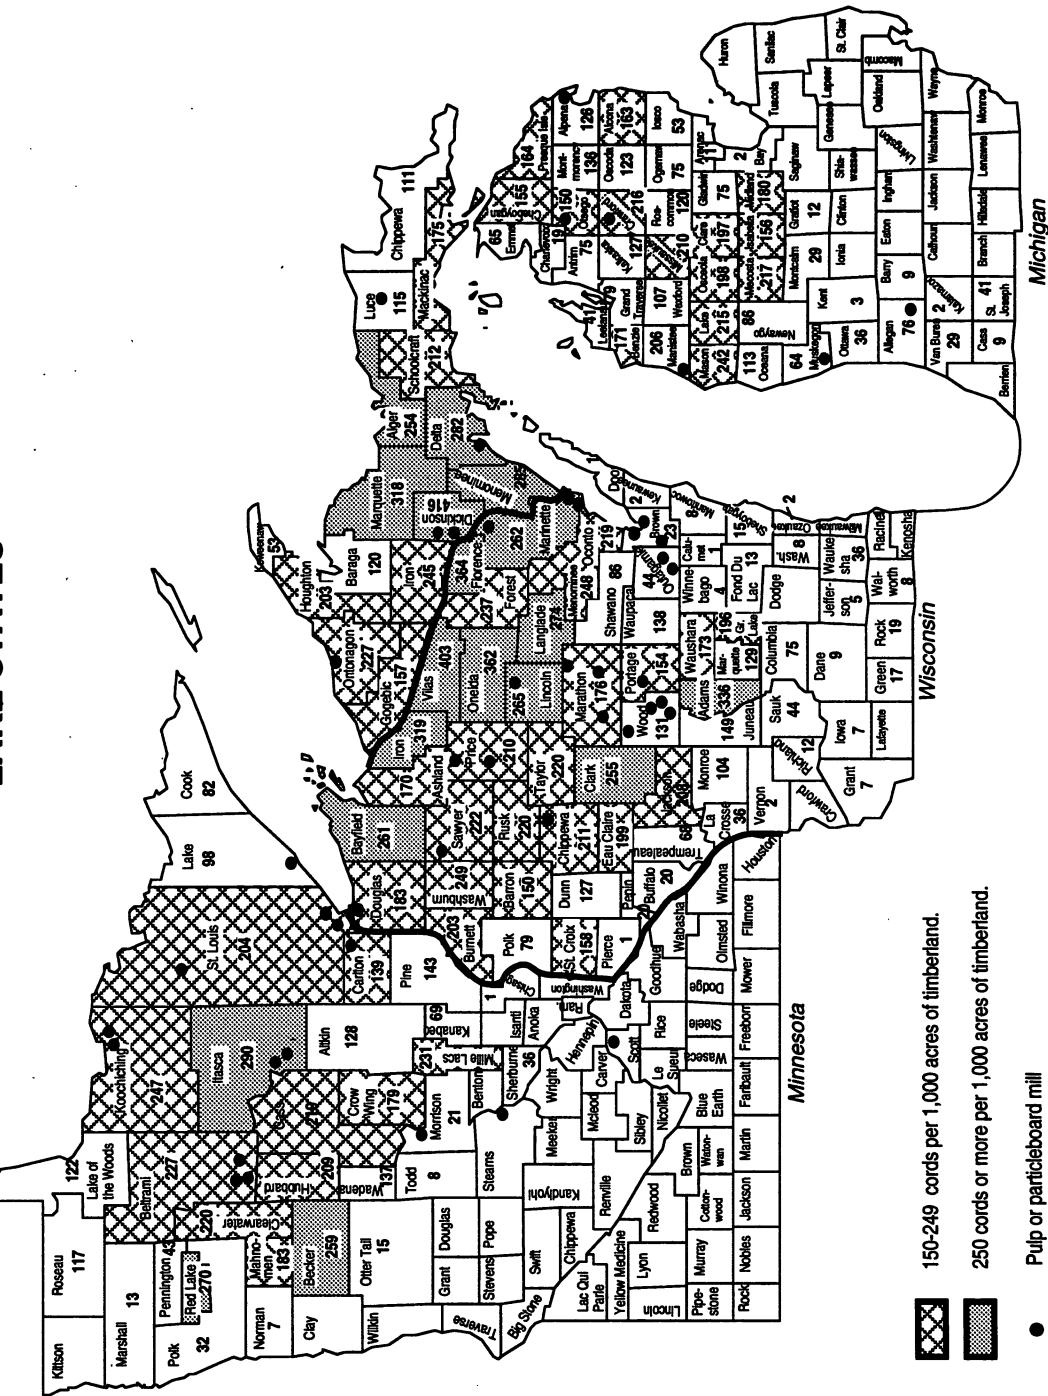

Figure 12.—Cords of pulpwood cut per 1,000 acres of timberland in principal pulpwood-producing counties, 1991. Acres of timberland (stocking of trees greater than 16.7 percent) were determined during the last inventory in each State. Locations of active pulp and particleboard mills are shown.

Pulpwood harvesting was most intensive (80 thousand cords or more in the following areas by species:

Species	State	Survey Unit
Jack pine	Wisconsin	Northwest, Central
	Michigan	Northern Lower Peninsula
	Minnesota	Northern Pine
Red pine	Wisconsin	Central
Spruce	Minnesota	Aspen-Birch
Balsam fir	Minnesota	Aspen-Birch, Northern Pine
Aspen	Minnesota	Aspen-Birch, Northern Pine
	Wisconsin	Central Hardwood Northeast, Northwest, Central
	Michigan	E. Upper Peninsula, W. Upper Peninsula, N. Lower Peninsula

- Cutting of certain species may exceed net growth in several Survey Units of the Lake States. This disparity is probably due to disease and mortality occurring in these species. Harvesting of overmature stands may be another reason. Future field surveys should help clarify these points.

Receipts

- Thirty-six woodpulp and twelve particle-board mills in the Lake States acquired 8.6 million cords of pulpwood in 1991, up 2 percent from 1990. The number of mills using aspen stayed constant at 40 (83 percent). There was increased use of other hardwoods (cherry and ironwood) and softwood residues, by some mills (fig. 13).

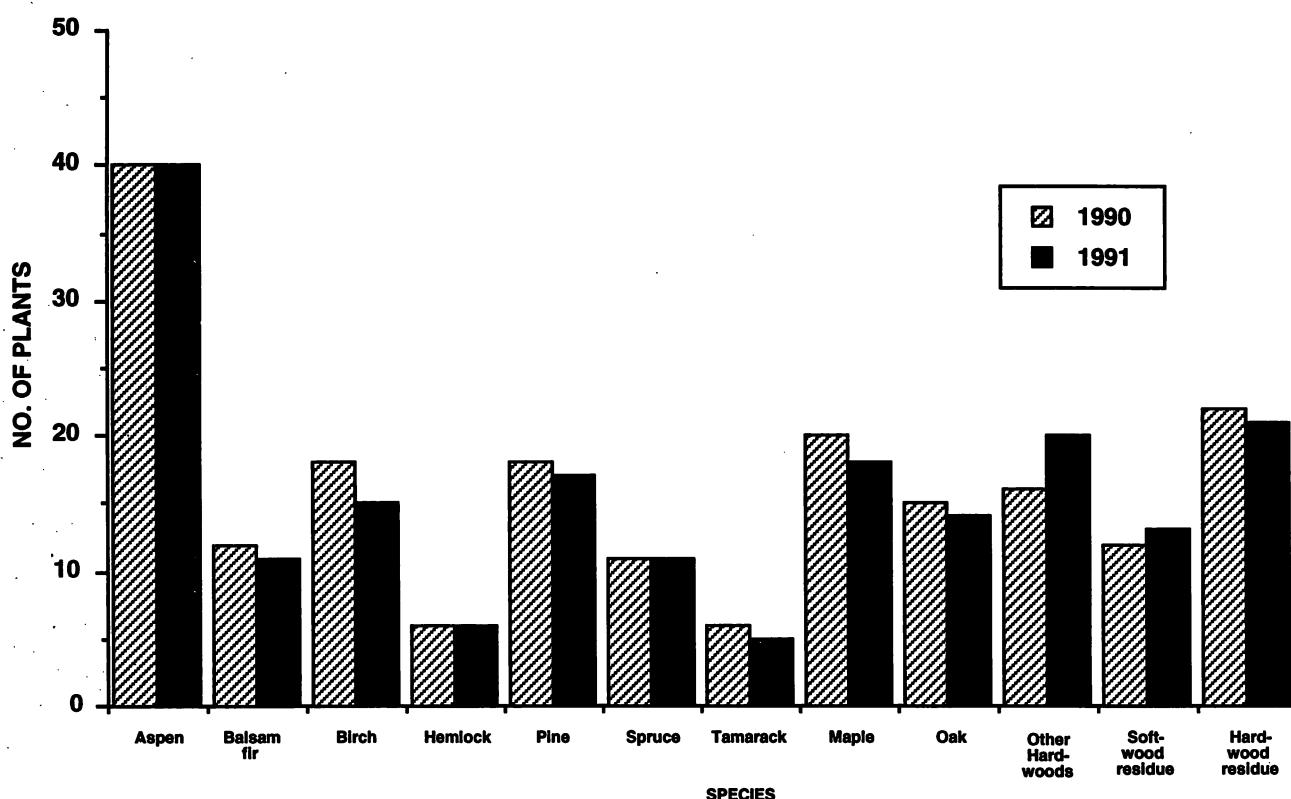

Figure 13.—Numbers of industrial plants in the Lake States using a particular species or residue for pulping and particleboard, 1990-1991.

- The Lake States provide many pulpwood mills with raw material. In 1991, Wisconsin supplied wood to 25 mills, Michigan supplied 26 mills, and Minnesota supplied 22 mills. Pulpwood mills outside the Lake States also received raw material from this region. Some 41 thousand cords were exported, mainly to Canada; Minnesota exported 21 thousand cords and Michigan exported 20 thousand cords.
- Softwood residue imported from Canada declined 2 percent in 1991 to 17 thousand cords. Softwood residue imported from States outside the region decreased 18 percent to 88 thousand cords. The main suppliers of the softwood residue from outside the Lake States are Montana, South Dakota, and Wyoming.

Michigan

- Eleven Michigan mills consumed 2.7 million cords, down 7 percent from last year. An estimated 264 thousand cords were supplied by out-of-State sources—down 1 percent from 1990. Wisconsin provided more than 90 percent of the imported wood. White birch, hard maple, aspen, balsam poplar, and soft maple were the primary species imported.

Wisconsin

- The 21 mills in Wisconsin consumed 2.9 million cords—a decline of 12 percent from 1990. Of that total, 414 thousand cords were supplied by out-of-State sources—a decrease of 27 percent from last year. Michigan supplied 284 thousand cords, Minnesota supplied 99 thousand cords, and Western States supplied 88 thousand cords. Principal imports were aspen, spruce, jack pine, and hard maple.

Minnesota

- The 16 mills in Minnesota reported consuming an estimated 2.4 million cords—Minnesota pulpwood receipts are not fully reported (see earlier explanation). Wisconsin furnished 69 thousand cords, Michigan 5 thousand cords, and Canada 30 thousand cords. Principal imports were aspen, balsam fir, spruce, soft maple, and jack pine.

Industry Trends and Analysis

Pulp Mills

In this section pulp mills will include wood fiber products such as paper, paperboard, hardboard, insulation board, and medium-density fiber board. All of these products are manufactured from wood that has been reduced to individual fibers, small fiber bundles, or fiber parts, which are subsequently formed into a mat.

- Of the 8.6 million cords of pulpwood harvested in 1991, 6.3 million cords (73 percent) were used for wood fiber products (pulp). Of each cord used to produce pulp, 92 percent was roundwood and 8 percent was residues.
- Principal species harvested for pulp were aspen (2.1 million cords), jack pine (595 thousand cords), hard maple (540 thousand cords), and soft maple (420 thousand cords). Other major species furnishing more than 200 thousand cords were balsam fir, red pine, spruce, and white birch. Hardwood and softwood residue accounted for 506 thousand cords of pulp in 1991.
- Aspen and other hardwoods are still the mainstays of the pulp mills in the region, but softwood use has increased steadily since 1988 (fig. 14). Residues for the same period have been steady at 450 to 500 thousand cords.
- Average daily woodpulp production was 13.6 thousand tons per day in 1991 (table 3). Kraft mills accounted for 40 percent of

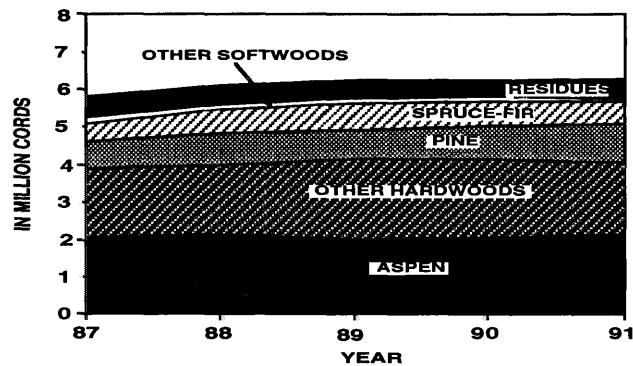

Figure 14.—Pulpwood production in the Lake States for pulp by species group, and residues, 1987-1991.

the total production, and groundwood and other mechanical process mills accounted for 31 percent. The remaining 29 percent was split between sulfite and semi-chemical process mills.

- Lake States pulpwood production for pulp mills in 1989-1991 was:

Species	Production		
	1989	1990	1991
	(Thousand cords)		
Roundwood			
Aspen	2,008	2,029	2,095
Softwoods	1,662	1,677	1,718
Other species	2,090	2,070	1,948
Residue	470	450	506
Total	6,230	6,226	6,267

Michigan

- Pulpwood production for wood fiber was 2.2 million cords in 1991. Aspen was the major pulpwood species harvested in the State with 600 thousand cords. Other species that contributed large amounts of wood were hard maple (328 thousand cords) and soft maple (233 thousand cords). Hardwood residue was a major contributor to the pulp industry with 137 thousand cords; softwood residue was 7 thousand cords.
- Michigan's primary wood fiber industry produces paper, corrugating medium, hardboard, and market pulp. An estimated 4,375 tons of pulp products are generated daily from the seven primary pulp mills. Two mills use groundwood processing, three mills use kraft processing, and three use semi-chemical process (table 3).
- Of the 238 thousand cords of pulpwood imported to Michigan mills for processing, Wisconsin provided 223 thousand cords, and Western States provided 15 thousand cords. The State of Michigan exported 20 thousand cords to other States outside the region for wood fiber. Balsam fir (8 thousand cords) and spruce (12 thousand cords) were the two species exported.

Minnesota

- Pulpwood harvested for wood fiber products totaled 1.4 million cords in 1991. Aspen

was the predominant species harvested in Minnesota with 734 thousand cords. Balsam fir (197 thousand cords) and spruce (141 thousand cords) were second and third, respectively. Jack pine was the only other species harvested for pulp, with more than 100 thousand cords. Hardwood and softwood residues for pulp amounted to 56 thousand cords and 28 thousand cords, respectively.

- Primary wood fiber products industries in Minnesota are paper, hardboard, roofing felt, and insulation board. An estimated 3,475 tons of pulp products were produced daily from the 10 primary pulp mills. The processes used in these mills to break down the wood into fiber are groundwood (four mills), other mechanical (three mills), and kraft (two mills) (table 3).
- Of the 104 thousand cords imported to Minnesota mills for pulp products, Michigan provided 5 thousand cords, Wisconsin furnished 69 thousand cords, and Canada provided 30 thousand cords. Minnesota exported 70 thousand cords to Wisconsin and 21 thousand cords to other States and Canada. Predominant species exported were aspen (16 thousand cords), balsam fir (2 thousand cords), jack pine (2 thousand cords), and spruce (2 thousand cords).

Wisconsin

- Pulpwood cut for wood fiber products totaled 2.7 million cords. Aspen was the main species harvested with 761 thousand cords in 1991. Other species producing more than 100 thousand cords were jack pine (339 thousand cords), white birch (253 thousand cords), red pine (322 thousand cords), hard maple (212 thousand cords), and soft maple (166 thousand cords). Softwood residue for pulp accounted for 74 thousand cords, and hardwood residue was 204 thousand cords.
- Primary wood fiber products industries in Wisconsin are paper, hardboard, and roofing felt. An estimated 5,763 tons of pulp products were produced daily from the 19 primary pulp mills. The processes used in these mills to break down the wood into fiber are groundwood and other mechanical (eight mills), sulfite (six mills), kraft (four mills), and semichemical (two mills) (table 3).

- Wisconsin mills imported 455 thousand cords of pulpwood; 281 thousand cords from Michigan, 70 thousand cords from Minnesota, 89 thousand cords from Western States, and 15 thousand cords from Canada. Wisconsin exported 223 thousand cords to Michigan, 69 thousand cords to Minnesota, and 4 thousand cords to mills outside the region. The predominant species exported were white birch (79 thousand cords), hard maple (53 thousand cords), soft maple (36 thousand cords), and aspen (22 thousand cords). Softwood and hardwood residues for pulp accounted for 32 thousand cords and 24 thousand cords, respectively.

Outlook

- A 2-percent increase in pulpwood production for wood fiber (pulp) mills in the Lake States during 1991 compares favorably with the 0.8-percent rise in U.S. paper and paperboard production.
- Total output of the U.S. paper and paperboard industry for 1991 was 78 million tons (38.5 million tons of paper and 39.5 million tons of paperboard).
- Pulpwood consumption in the U.S. totaled 98 million cords in 1991.

Particleboard Mills

Particleboard is a generic term for a panel manufactured from lignocellulosic material—commonly wood—essentially in the form of particles (as distinct from fibers). These materials are bonded together with synthetic resin or other suitable binder under heat and pressure, by a process in which the interparticle bonds are created wholly by the added binder and to which other materials may have been added during manufacture to improve certain properties. The many types of particleboard differ greatly in regard to size and geometry of the particle, the amount of resin (adhesive) used, and the density to which the panel is pressed.

The major types of particles used for particleboard are shavings, flakes, wafers, chips, sawdust, strands, slivers, and wood wool (excelsior). Most particleboard in the U.S. is made from residues (shavings, sawdust, or chips), but some types require roundwood (saw logs or pulpwood). Wafer board is an example of a product requiring that particles be cut from solid wood.

- Lake States loggers harvested 2.3 million cords of pulpwood in 1991 for particleboard products. For every 100 cords of pulpwood used in particleboard manufacture, 91 percent came from roundwood and 9 percent was residues from wood-using plants (sawmills, veneer mills, etc.).
- Principal species harvested for particle board products were aspen (1.8 million cords), jack pine (127 thousand cords), and soft maple (54 thousand cords). Other major species used were red pine and white birch. Residues used in particleboard production totaled 194 thousand cords (fig 15).

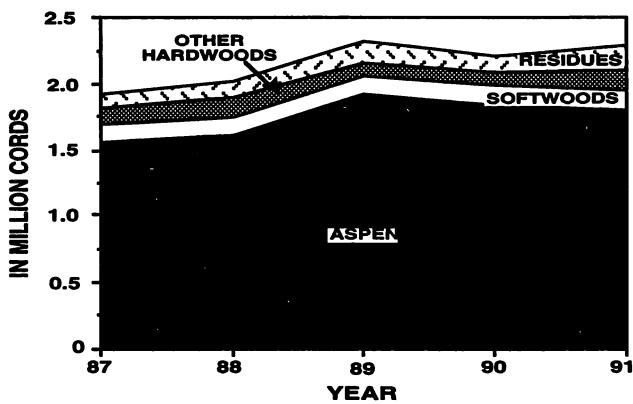

Figure 15.—Pulpwood production for particleboard in the Lake States, 1987-1991.

- Annual production capacity of the Lake States particleboard plants is 1,706 million square feet, as shown on the next page:

Company	Location	Production capacity
		(Million square feet 3/4-inch basis)
Georgia-Pacific	Gaylord, MI	227
Louisiana-Pacific	Newberry, MI	55
Louisiana-Pacific	Sagola, MI	180
Weyerhaeuser Co.	Grayling, MI	180
Louisiana-Pacific	Two Harbors, MN	65
Potlatch Corp.	Grand Rapids, MN	165
Northwood Panelboard Co.	Solway, MN	160
Potlatch Corp.	Bemidji, MN	240
Potlatch Corp.	Cook, MN	122
Louisiana-Pacific	Hayward, WI	230
Rodman Industries	Marinette, WI	22
Weyerhaeuser Co.	Marshfield, WI	60
All companies		1,706

- Lake States pulpwood production for particleboard mills in 1989-1991 was:

Species	Production		
	1989	1990	1991
	(Thousand cords)		
Roundwood			
Aspen	1,914	1,840	1,786
Softwoods	144	140	158
Other species	89	103	148
Residue	161	126	194
Total	2,308	2,209	2,286

- Although national housing starts dropped 15 percent in 1991 to 1.0 million units, an increase in remodeling and development of new particleboard-based products accounted for a 4-percent increase in Lake States pulpwood production for particleboard products.

Michigan

- Pulpwood harvested for particleboard products totaled 842 thousand cords in 1991, of which aspen made up 494 thousand cords. Other major species cut were jack pine (91 thousand cords) and soft maple (54 thousand cords). Hardwood and softwood residues used for particleboard totaled 109 thousand cords.
- Michigan's particleboard industry produces oriented-strand board, oriented wafer

board, and particleboard. An estimated capacity of 613 million square feet at 3/4-inch thickness can be produced by the four mills in Michigan. Three mills used roundwood for raw material and one mill used whole-tree-chips from the field and mill residues in their process.

- The particleboard mills in Michigan imported more than 2 thousand cords of hardwood residue from Canada. Michigan mills also received 45 thousand cords of aspen from Wisconsin. Raw materials exported for particleboard production amounted to 22 thousand cords; half was aspen and the other half residues.

Minnesota

- Timber logged for particleboard products totaled 1.0 million cords. The predominant species cut was aspen with 964 thousand cords, or 96 percent of the total. The remaining 4 percent was comprised of jack pine (30 thousand cords), balsam poplar (10 thousand cords), white birch (3 thousand cords), and softwood residues (2 thousand cords).
- Minnesota's particleboard industry produces oriented-strand board and oriented wafer board. Particleboard output capacity from the mills in the State was an estimated 582 million square feet at 3/4-inch thickness for 1991. Roundwood was the predominant form of raw material used for particleboard products in the State.
- The particleboard mills in Minnesota did not import any raw materials for production. In 1991, raw materials exported from the State for particleboard manufacturing totaled 31 thousand cords; 29 thousand cords of aspen and 2 thousand cords of softwood residues were shipped to Wisconsin.

Wisconsin

- Wisconsin produced 426 thousand cords of wood for particleboard manufacturing. The main species harvested was aspen with 328 thousand cords, or 88 percent of the total. Other major species cut were jack pine (6 thousand cords), balsam poplar (5 thousand cords), red pine (2 thousand cords), and

balsam fir (2 thousand cords). The remaining raw material used was softwood residue (20 thousand cords) and hardwood residue (64 thousand cords).

- The particleboard industry in Wisconsin produces particleboard and oriented-strand board. Wisconsin's particleboard output capacity totaled an estimated 267 million square feet at 3/4-inch thickness in 1991. The mills used equal amounts of roundwood and residues for raw material in manufacturing particleboard products.
- The mills in Wisconsin imported 56 thousand cords of wood for particleboard manufacturing; of these, Canada provided 3 thousand cords of softwood residues, Michigan provided 11 thousand cords of aspen and 11 thousand cords of residues, and Minnesota provided 31 thousand cords of wood (29 thousand cords of aspen and 2 thousand cords of softwood residues). Wisconsin exported more than 50 thousand cords of aspen to Michigan particleboard mills in 1991.

New Mills and Expansions

These major pulp mill expansion and new construction efforts are underway:

- The expansion program of Consolidated Papers, Inc., is scheduled to be completed in the near future.
- Louisiana-Pacific Corp. is building an OSB (oriented-strand board) plant in Tomahawk, Wisconsin, which is scheduled to be completed in 1993.
- The Combined Locks, Wisconsin expansion of Appleton Papers, Inc., is scheduled for completion in 1994.

Idle, Closed, or Converted Mills

One major pulp mill is closing:

- Green Bay Packaging Inc. in Green Bay, Wisconsin (closing pulp mill only).

CENTRAL STATES

Production

- Pulpwood production in the Central States (Illinois, Indiana, Iowa, and Missouri) dropped 9 percent from the 1990 production of 374 thousand cords to 339 thousand cords in 1991. Hardwood residue from primary wood-using mills made up 70 percent of total production. Softwood roundwood increased from 9 thousand cords in 1990 to 11 thousand cords in 1991 (fig. 16).

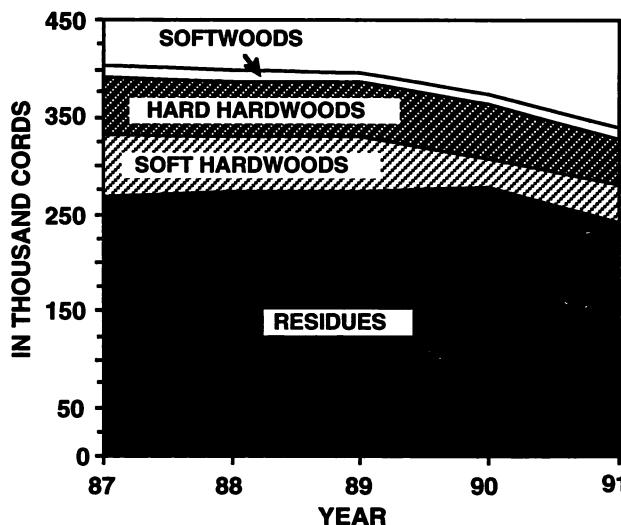

Figure 16.—Pulpwood production in the Central States, 1987-1991.

- Soft hardwood⁷ roundwood pulpwood production increased by 35 percent—from 31 thousand cords in 1990 to 42 thousand cords in 1991. Hard hardwood⁸, on the other hand, decreased from 56 thousand cords in 1990 to 46 thousand cords in 1991—an 18-percent decline. Exports of roundwood and residues from the Central States decreased 8 percent to 215 thousand cords. Central States pulpwood was shipped to Kentucky, Wisconsin, Oklahoma, and Michigan mills.

⁷Hardwood species with an average specific gravity of 0.50 or less.

⁸Hardwood species with an average specific gravity greater than 0.50.

- The primary wood fiber industries in the Central States are roofing insulation and corrugating-medium. An estimated 720 tons of woodpulp products were produced daily from three mills. The processes used in these mills to break down the wood into fiber are semi-chemical and mechanical.
- Loggers harvested pulpwood in 17 counties of Illinois; in 14 counties in western and central Indiana; in 5 counties in eastern Iowa; and in 10 counties in northeast, central, and southeast Missouri (fig. 17).

Illinois

- Illinois produced 81 thousand cords of pulpwood in 1991, 24 percent of the total production in the Central States (fig. 18). Soft hardwood was the largest species group of roundwood harvested from Illinois with 19 thousand cords or 23 percent of the State total. Hard hardwood was the second largest species group, although reduced from 20 thousand cords in 1990 to 17 thousand cords in 1991. Softwoods comprised 12 percent of the total pulpwood production in Illinois. Hardwood residues accounted for 42 percent of the pulpwood production in the State.
- Illinois does not have any primary wood-pulp mills, so all pulpwood harvested is shipped to plants outside the State. Of the pulpwood harvested in 1991, about 46 percent was shipped to mills in the Central States—mainly Indiana and Iowa—and the remaining 54 percent was sent to States outside the region, such as Kentucky.

Indiana

- Pulpwood production in Indiana accounted for almost half of the total pulpwood harvested in the Central States region in 1991, 157 thousand cords. Roundwood pulpwood production in Indiana was 29 thousand cords or 18 percent of the State total. The hard hardwood species group had the highest production of roundwood with 76 percent. Soft hardwoods accounted for the remaining 24 percent of the roundwood harvested. Hardwood residues accounted for 82 percent of the pulpwood produced in Indiana.

- Pulpwood shipped to mills outside the north-central region totaled 101 thousand cords, 64 percent of the States total pulpwood production. The remaining 36 percent was used by mills in the Central and Lakes States regions.

Iowa

- The total pulpwood production in 1991 was 14 thousand cords, 4 percent of the region's total. Soft hardwood pulpwood production was 6 thousand cords or 43 percent of the State's total. Hard hardwood harvested for pulp was 2 thousand cords of the 1990 production. Hardwood residues accounted for 43 percent of pulpwood production in Iowa or 6 thousand cords.

Missouri

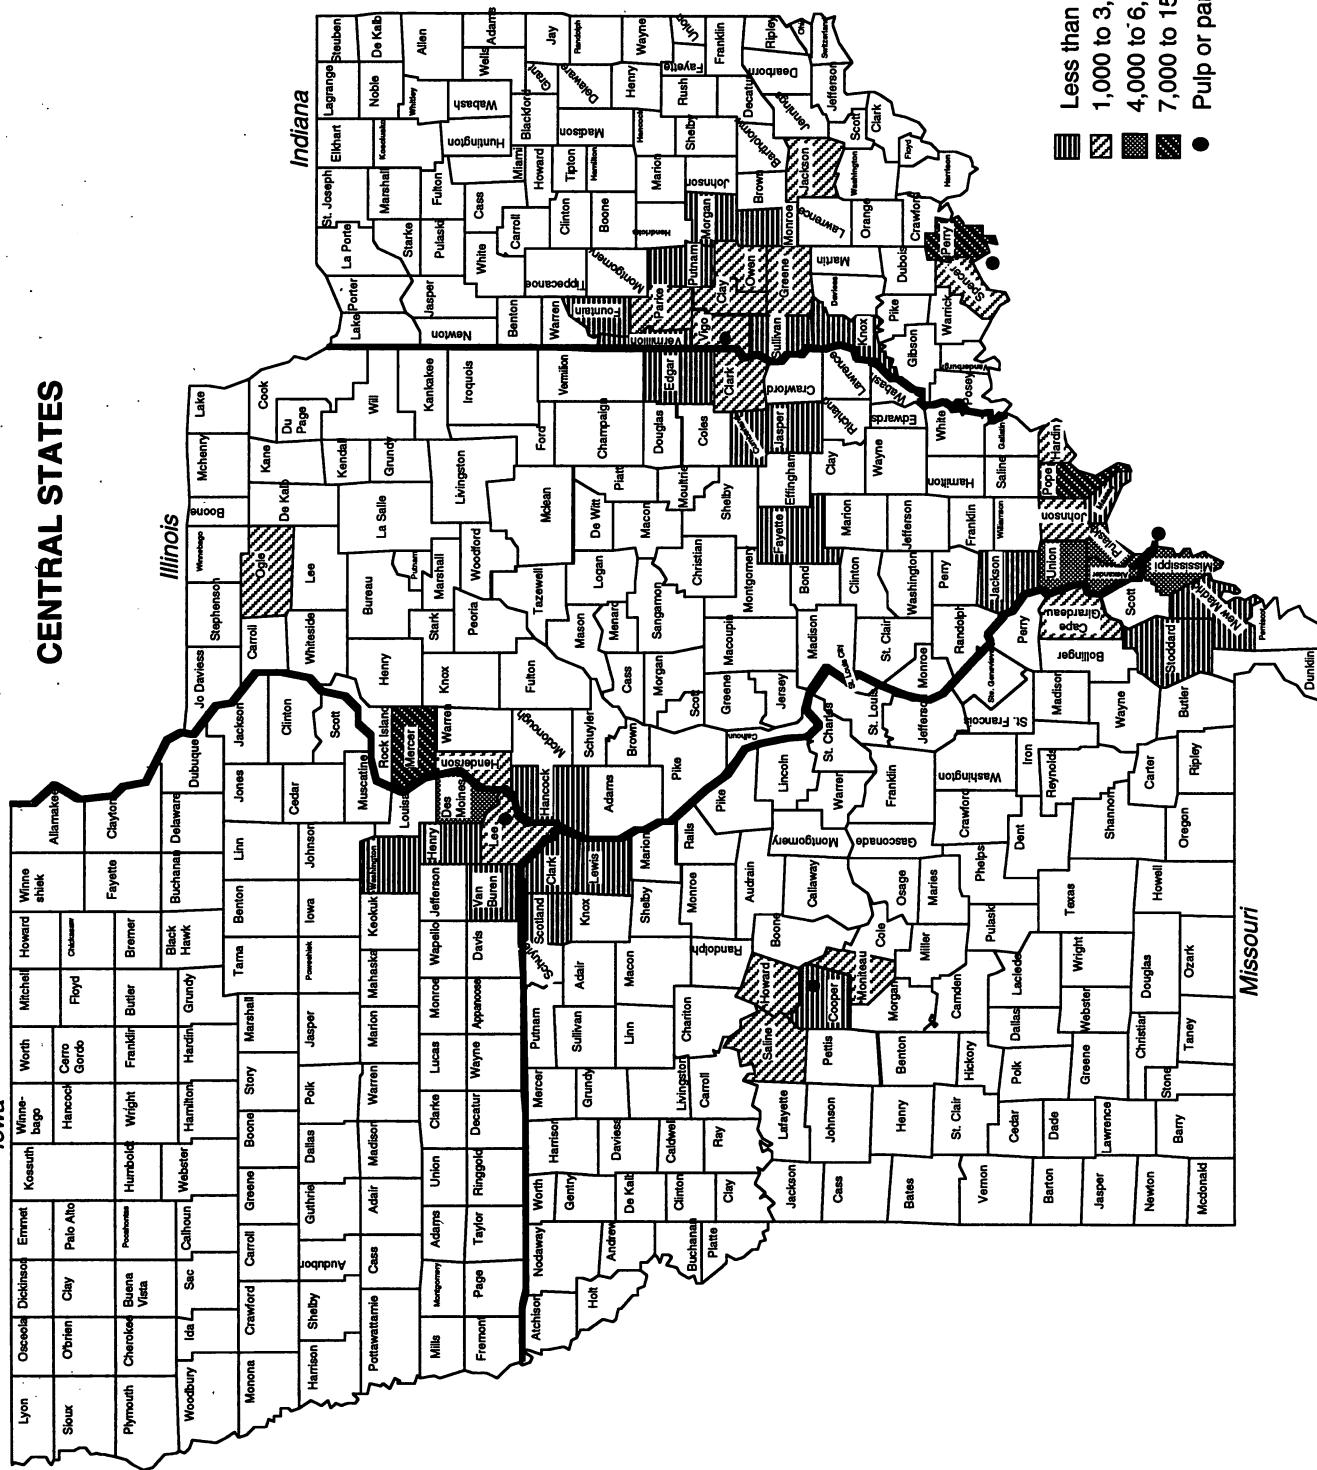

- Missouri was the second largest producer of pulpwood material in the Central States region at 87 thousand cords or 26 percent of the region's total. The largest roundwood species group harvested in the State for pulp soft hardwood accounted for 11 percent of Missouri's total pulpwood production. Hard hardwood species produced 5 thousand cords of roundwood or 6 percent of the State total pulpwood harvest. Residues, the main source of pulpwood fiber, accounted for the remaining 82 percent of the total pulpwood production in Missouri.
- Missouri exported 70 thousand cords or 80 percent of the State's pulpwood production to mills outside the region, mainly in Kentucky and Oklahoma.

Receipts

- Pulp mills in three Central States received 129 thousand cords in 1991, down 9 percent from 1990. Total roundwood receipts remained at the 1990 level of 44 thousand cords. Soft hardwood accounted for a 38-percent increase in receipts while hard hardwood receipts declined 46 percent between 1990 and 1991.
- Hardwood residue decreased 14 percent from 97 thousand cords in 1990 to 85 thousand cords in 1991.

Iowa

CENTRAL STATES

APPENDIX

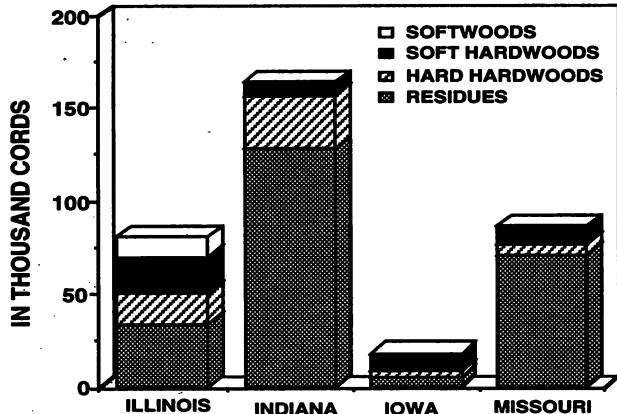

Figure 18.—Central States pulpwood production by species group, 1991.

- No softwoods were used for pulpwood for the eighth consecutive year in the Central States.

Industry Trends and Analysis

- Average daily pulp production remained the same from 1990 to 1991 at 510 tons (table 5).
- Mills in the adjacent States remain the dominant market for Central States pulpwood.
- Hardwood residue from sawmills continues to be the dominant form of pulpwood procured from Central States mills.
- Central States production of roundwood pulpwood was 99 thousand cords in 1991, up 3 percent from 1990.

Conversion Factors Used in the Lake States

Standard cords of green roundwood per green ton:

Species	Factor
Cedar	0.6329
Balsam fir	.4688
Hemlock	.4150
Jack pine	.4688

1/ Factors used in converting to standard green cords (128 cu. ft. including bark and air space) were:

4,266 pounds of softwood roundwood;

4,795 pounds of soft hardwood roundwood;

5,394 pounds of hard hardwood roundwood;

4,100 pounds of softwood chips (green mill residue);

4,400 pounds of hardwood chips (green mill residue);

2,500 pounds of chips (all species, dry mill residue).

2/ Vertical columns of figures under box heading "Production by States" present the amount of pulpwood cut in each State.

3/ Pulpwood shipped to mills outside the region.

4/ Hardwood species with an average specific gravity of 0.50 or less.

5/ Combined to prevent disclosure of individual mill receipts.

6/ Hardwood species with an average specific gravity greater than 0.50.
