TEMPERATURE AND DISSOLVED OXYGEN DATA
FOR LAKE ONTARIO, 1972 (IFYGL)*

Janice Dinegar Boyd and Brian J. Eadie

Continuous dissolved oxygen profiles taken in Lake Ontario in 1972 (IFYGL) have been edited, corrected, and averaged over 2-m intervals and over up and down traces to give temperature, dissolved oxygen, and oxygen percent saturation profiles at up to 27 discrete depths. For each cruise a statistical summary of the three variables is presented, and tables of the actual values are given for each available cruise and station combination. The data are available on magnetic tape from the National Climatic Center, Asheville, N.C.

1. INTRODUCTION

During the 1972-73 joint Canadian-United States International Field Year for the Great Lakes (IFYGL), the National Oceanic and Atmospheric Administration (NOAA) furnished two oceanographic research vessels to measure periodically a number of variables at stations throughout Lake Ontario. On board one of these vessels, the U.S. RV *Researcher*, was a submersible assembly containing an electrobathythermograph (EBT), an *in situ* dissolved oxygen monitor (DOM), and a rosette multisampler array for obtaining water samples at specified depths. For a description of U.S. ship systems, see Robertson (1974). Data tapes including the *Researcher* EBT and oxygen data are available from IFYGL Data Management, National Climatic Center (NCC), Federal Building, Asheville, N.C. 28801. Edited depth, temperature, dissolved oxygen, and oxygen percent saturation values calculated from these data tapes, plus a statistical summary, are given in this report.

2. DATA COLLECTION AND CALIBRATION

Depth and temperature values on the original NCC data tapes were in meters and degrees centigrade, and claimed accuracies are ± 1 percent and ± 0.02 percent (Robertson, 1974). Editing for obviously bad values was necessary. Oxygen values were recorded in volts and needed considerable correction and processing. Four factors had to be considered:

- 1) Salinity and temperature corrections
- 2) Calibration factors
- 3) Flow sensitivity
- 4) Instrument response time

*GLERL Contribution No. 158.

Salinity and temperature corrections were done as described in Pijanowski (1973). Calibration of the DOM was assumed done as described in Section 4.4.1.2c on the MINOS DOM Operating and Maintenance Instructions (Beckman Instruments, Inc., 1971). A calibration factor of 2 was obtained for the 12 cruises for which a calibration record was found. Conversion of the oxygen data from volts to ml (STP)/l was then

$$O \text{ (ml/l)} = 2 \cdot [-0.002 \cdot T \text{ (}^{\circ}\text{C)} = 1.27] \cdot O \text{ (volts)},$$

with an accuracy of $\pm 0.3 \text{ ml/l}$ [National Oceanographic Instrumentation Center (NOIC), 1972]. This accuracy, however, was dependent upon the instrument's moving sufficiently rapidly in the water, a condition not always met as the instrument package approached bottom and as it halted for water samples on the upcast. It was assumed that values taken when the package was moving less than 0.25 m/sec were not reliable (NOIC, 1972, and our empirical results). Data values were retained for one response time after a decline in speed below 0.25 m/sec, then rejected until one response time after an increase in speed above 0.25 m/sec. Response times were calculated according to Pijanowski (1973). This screened oxygen data and the temperature data were averaged over 2-m intervals, a depth range corresponding roughly to one response time at the average speed at which the package moved and at the average temperatures encountered. A final response time correction was then made to the oxygen data by shifting the depth of the downcast values up 2 m and the depth of the upcast values down 2 m. Downcast and upcast values were averaged to produce a corrected profile and any missing values were linearly interpolated. Oxygen values in millilitres (STP) per litre were converted to milligrams per litre by multiplication by 1.4286. Oxygen percent saturation was calculated according to Table 74 in Hutchinson (1957).

3. CONCLUSIONS

U.S. IFYGL ship station locations are given in Figure 1 and Table 1 and cruises for which Researcher oxygen and EBT data are available for these stations are listed in Table 2. Table 3 indicates for which cruise/station combinations useful data were found. A statistical summary of the data is presented in Appendix A and the actual depth, temperature, dissolved oxygen, and percent saturation values for all available cruise/station combinations follow in Appendix B. Times given are GMT, which is 5 hours ahead of EST. Oxygen data above 6 m were unreliable, so no values are given above this depth. Similarly, oxygen data near bottom are not presented. Deeper than 40 m, temperature and oxygen values changed very little, so only selected depths are given.

The data in Appendix B are available on magnetic tape from IFYGL Data Management, Room 17, National Climatic Center, Federal Building, Asheville, N.C. 28801. Specify catalog number USA1-101-024-001 when requesting the data.

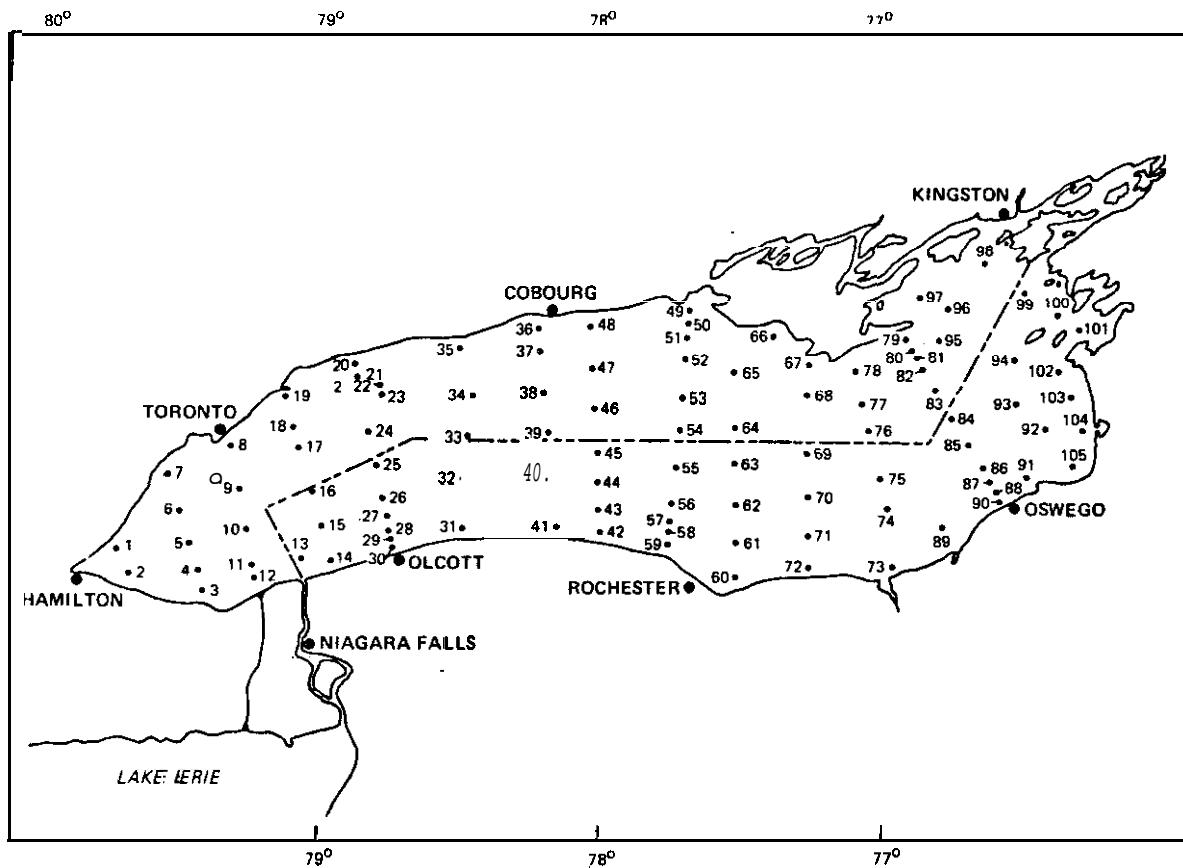

Figure 1. Location of U.S. ship stations on Lake Ontario during IFYGL.

An attempt was made to evaluate the accuracy of the oxygen data. In some cases dissolved oxygen values from water samples off the rosette multisampler array had been taken by using the Winkler method or an on-board oxygen probe, but examination of the data set showed so many obviously wrong values that it was decided to discard the data completely. A suitable Canadian data set was available for comparison, however. In a few instances Canadian personnel from Canada Centre for Inland Waters had collected oxygen data within a few days and a few miles of several IFYGL cruise/station combinations. These values agreed with our downtrace oxygen data to within ± 0.5 mg/l. Because of this and because our values all lie within the expected ranges for Lake Ontario (see, for example, Sweers, 1969), we feel the oxygen data are reasonably accurate, but cannot be more specific.
