The Pacific Northwest region is an area where fire has always played a prominent role in the natural environment. Long before towns and subdivisions were established across the landscape, fires were a natural result of the frequent summer thunderstorms that travelled across the mountains and plains. However, decades of fire suppression have resulted in fuel conditions that have the potential to create intense wildfires.

Within this natural fire environment, there are individual houses, subdivisions, and entire communities. Many homes, however, would be unable to survive an intense wildfire. Since it is not a question of “if” wildfires will occur but “when,” they will occur, the likelihood of human life and property loss is great and growing.

Our ability to live more safely in this fire environment greatly depends upon our use of “pre-fire activities.” Pre-fire activities are actions taken before a wildfire occurs which improve the survivability of people and homes. They include proper vegetation management around the home (known as defensible space), use of fire resistant building materials, appropriate subdivision design, and other measures. Research clearly demonstrates that pre-fire activities save lives and property.

THE “WHY WE’RE WORRIED ABOUT WILDFIRE” EQUATION

Fire is a natural part of our environment. Our forests and rangelands were burning long before there were settlements in the Pacific Northwest. + People are living in this fire environment. Many homes are built and maintained without regard to wildfire. + With more people using our wildlands, there is a greater chance of fire starts. + Today’s wildfires can burn intensely and be difficult to control. = Potential for:
• Greater loss of life
• Increased property losses
• More damage to natural resources
• More money needed for firefighting.

THE FIRE ENVIRONMENT

Firefighters recognize three components of the fire environment: weather, topography and fuel. These components affect the likelihood of a fire starting, the speed and direction at which a wildfire will travel, the intensity at which a wildfire burns and the ability to control and extinguish a wildfire. Although weather and topography cannot be changed, the fuels (or vegetation) can be modified. Consequently, many of our opportunities to reduce the wildfire threat lie in proper management and manipulation of wildland vegetation.

WEATHER: Dry, hot and windy weather increases the likelihood of a major wildfire. These conditions make ignition easier, allow fuels to burn more rapidly and increase fire intensity. High wind speeds, in particular, can transform a small, easily controllable fire into a catastrophic event in a matter of minutes.

TOPOGRAPHY: Of topographic features, steepness of slope most influences fire behavior. As the steepness of slope increases, the fire spreads more quickly. Other important topographic features include aspect (south and southwest slopes usually have more fires) and steep, narrow drainages (chimneys), which can significantly increase the rate of firespread.

FUEL: Fuel is required for any fire to burn. In regard to wildfire, fuels almost always consist of living vegetation (trees, shrubs, grass, and wildflowers) and dead plant material (dead trees, dried grass, fallen branches, pine needles, etc.). Houses, when involved in a wildfire, become a source of fuel. The amount, size, moisture content, arrangement and other fuel characteristics influence ease of ignition, rate of fire spread, length of flames produced and other fire behaviors.

THE HUMAN ENVIRONMENT: When people are living in high-hazard fire environments, the human-built environment becomes an important factor in predicting the loss of life and property. Untreated wood shake and shingle roofs, narrow roads, limited access, lack of fire-wise landscaping, inadequate water supplies and poorly planned subdivisions are examples of increased risk to people living with the threat of wildfire.
**EXAMPLES OF LOCAL FIRE BEHAVIOR***

Presented below are five types of vegetation common to our region with computer generated estimates of how they would burn under certain conditions. These predictions assume a wind speed of 20 mph, flat terrain, typical moisture contents of living and dead vegetation for summertime, and normal August weather for our area. It is important to note that fire size and rate of spread is largely determined by spotting (embers/firebrands that are thrown ahead and to the sides of actively burning fires). Spotting results in smaller fires that may contribute to the main fire size and rate of spread.

**CHEATGRASS:** Cheatgrass is an invasive annual grass that usually occupies areas formerly vegetated with big sagebrush. It can dominate old burned areas, abandoned pastures, and other disturbed areas.

**MIXED BRUSH:** This represents a variety of brush species of varying heights with an understory of grasses and litter. This type is very common in the foothills surrounding the valleys.

**BIG SAGEBRUSH/BITTERBRUSH:** This is a heavy brush type consisting of large big sagebrush, bitterbrush, and sometimes mountain mahogany. Usually large amounts of dead woody material are present.

**DENSE CONIFER FOREST:** Thick stand of mature pine, fir and other conifers. There are mixed layers of vegetation among young trees, seedlings and shrubs. There is a large amount of dead or down woody material, needles and organic matter on the forest floor.

**OPEN PINE FOREST:** This type consists of open, park-like lodgepole and/or ponderosa pine, often interspersed with fir and other coniferous trees. The understory consists of pine needles, a variety of grasses, and often dense saplings.

**CROWN FIRES:** Crown fires occur when a ladder of vegetation allows fire to climb to tops of pine and fir trees. Flames can jump 100+ feet high and send burning embers more than a mile away.

---

**THE LIMITATIONS OF WILDLAND FIREFIGHTING**

A lot of people assume that when a wildfire starts, it will be quickly controlled and extinguished. This is an accurate assumption 97% of the time. Firefighters have the ability, equipment, and technology to effectively suppress most wildfires. But 3% of the time wildfires burn so intensely that there is little firefighters can do. Presented at right are firefighter tactics as they relate to wildfire flame length. Compare this to the flame lengths shown in "Examples of Local Fire Behavior."

**FLAME LENGTH**

<table>
<thead>
<tr>
<th>FLAME LENGTH</th>
<th>EFFECTIVE FIRE SUPPRESSION TACTICS*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 4 feet</td>
<td>Fireline constructed with hand tools, such as shovels and axes, can be effective at the front of the fire.</td>
</tr>
<tr>
<td>4 to 8 feet</td>
<td>Bulldozers and other heavy equipment will be needed to construct an effective fireline. Where bulldozers are not available, fire engines with hoses and water will be required to “knock down” the flames before the fire crews with hand tools can be effective. Or fire crews must construct a fireline at a considerable distance from the fire.</td>
</tr>
<tr>
<td>8 to 11 feet</td>
<td>Airtankers with fire suppressing retardant or helicopters with water are required to reduce the fire’s rate of spread before fireline construction by crews or bulldozers can be effective.</td>
</tr>
<tr>
<td>More than 11 feet</td>
<td>Direct fire suppression efforts will be ineffective. Retreat to existing roads, streams and other barriers. Burn out vegetation between the fireline and the advancing fire front to eliminate wildfire fuels.</td>
</tr>
</tbody>
</table>

*Photograph courtesy of Ben Hammack.*

When wildfire flame lengths exceed 11 feet, direct firefighting efforts are ineffective. Under these conditions firefighters use roads, streams, and other barriers to control the wildfire.
More and more homes are being built in high fire hazard environments.

In the 1980’s, the term “defensible space” was coined to describe vegetation management practices aimed at reducing the wildfire threat to homes. This article responds to some of the commonly asked questions about defensible space.

WHAT IS DEFENSIBLE SPACE?
Defensible space is the area between a house and an oncoming wildfire where the vegetation has been modified to reduce the wildfire threat and provide an opportunity for firefighters to effectively defend the house. Sometimes, a defensible space is simply a homeowner’s properly maintained backyard.

WHAT IS THE RELATIONSHIP BETWEEN VEGETATION AND WILDFIRE THREAT?
Many people do not view the plants growing on their property as a threat. But in terms of wildfire, the vegetation adjacent to their homes can have considerable influence upon the survivability of their houses. A well-vegetated landscape with plants native to the area as well as ornamental plants is potential wildfire fuel. If vegetation is properly modified and maintained, a wildfire can be slowed, the length of flames shortened, and the amount of heat reduced, all of which assist firefighters to defend the house. Sometimes, a defensible space is simply a homeowner’s properly maintained backyard.

WHAT IS DEFENSIBLE SPACE REQUIRE A LOT OF BARE GROUND IN MY LANDSCAPE?
No. Unfortunately, many people have this misconception. While bare ground is certainly effective in reducing the wildfire threat, it is unnecessary and unacceptable due to appearance, soil erosion, and other reasons. Many homes have attractive, well-vegetated landscapes that also serve as effective defensible space.

DOES CREATING A DEFENSIBLE SPACE REQUIRE ANY SPECIAL SKILLS OR EQUIPMENT?
No. For the most part, creating a defensible space employs routine gardening and landscape maintenance practices such as pruning, mowing, weeding, plant removal, appropriate plant selection, and irrigation. Equipment needed includes common tools like a chain saw, pruning saw, pruning shears, loppers, weed-eater, shovel, and a rake. A chipper, compost bin, or a large rented trash dumpster may be useful in disposing of unwanted plant material.

HOW BIG IS AN EFFECTIVE DEFENSIBLE SPACE?
Defensible space size is not the same for everyone, but varies by slope and type of wildland vegetation growing near the house. See the article entitled “Creating An Effective Defensible Space” for specific information.

THE THREE R’s OF DEFENSIBLE SPACE

<table>
<thead>
<tr>
<th>Removal</th>

<tbody>
<tr>
<td>Replacement is substituting less flammable plants for more hazardous vegetation. Removal of a dense stand of flammable shrubs and planting an irrigated, well maintained flower bed is an example of replacement.</td>
</tr>
</tbody>
</table>

THE FIRE DEPARTMENT IS SUPPOSED TO PROTECT MY HOUSE, SO WHY BOTHER WITH DEFENSIBLE SPACE?
Some individuals incorrectly assume that a fire engine will be parked in their driveway and firefighters will be actively defending their homes if a wildfire approaches. During a major wildfire, it is unlikely there will be enough firefighting resources available to defend every home. In these instances, firefighters will likely select homes they can most safely and effectively protect. Even with adequate resources, some wildfires may be so intense that there may be little firefighters can do to prevent a house from burning. The key is to reduce fire intensity as wildfire nears the house. This can be accomplished by reducing the amount of flammable vegetation surrounding a home. Consequently, the most important person in protecting a house from wildfire is not a firefighter, but the property owner. And it’s the action taken by the owner before the wildfire occurs (such as proper landscaping) that is most critical.

DOES DEFENSIBLE SPACE MAKE A DIFFERENCE?
Yes. Investigations of homes threatened by wildfire indicate that houses with an effective defensible space are much more likely to survive a wildfire. Furthermore, homes with both an effective defensible space and a nonflammable roof (composition shingles, tile, metal, etc.) are many times more likely to survive a wildfire than those without defensible space and flammable roofs (wood shakes or shingles). These conditions give firefighters the opportunity to effectively and safely defend the home.

DOES HAVING A DEFENSIBLE SPACE GUARANTEE MY HOUSE WILL SURVIVE A WILDFIRE?
No. Under extreme conditions, almost any house can burn. But having a defensible space will significantly improve the odds of your home surviving a wildfire.

WHY DOESN’T EVERYONE LIVING IN A HIGH WILDFIRE HAZARD AREA CREATE A DEFENSIBLE SPACE?
The specific reasons for not creating a defensible space are varied. Some individuals believe “it won’t happen to me”. Others think the costs (time, money, effort, loss of privacy, etc.) outweigh the benefits. Some fail to implement defensible space practices simply because of lack of knowledge or misconceptions.

FREQUENTLY ASKED QUESTIONS ABOUT DEFENSIBLE SPACE

- **Increasing the moisture content of soil.**
- **Decreasing the amount of flammable vegetation.**
- **Shortening plant height.**
- **Altering the arrangement of plants.**

This technique involves the elimination of entire plants, particularly trees and shrubs, from the site. Examples of removal are cutting down a dead tree or cutting out a flammable shrub.

The removal of plant parts, such as branches or leaves, constitute reduction. Examples of reduction are pruning dead wood from a shrub, removing low tree branches, and mowing dried grass.

Replacement is substituting less flammable plants for more hazardous vegetation. Removal of a dense stand of flammable shrubs and planting an irrigated, well maintained flower bed is an example of replacement.

**Effective Defensible Space** provides detailed information or misconceptions.

**Defensible Space**. The article “Creating An Effective Defensible Space” provides detailed information about changing vegetation characteristics for defensible space.

**Equipment needed includes common tools like a chain saw, pruning saw, pruning shears, loppers, weed-eater, shovel, and a rake. A chipper, compost bin, or a large rented trash dumpster may be useful in disposing of unwanted plant material.”**

**Defensible space size is not the same for everyone, but varies by slope and type of wildland vegetation growing near the house. See the article entitled “Creating An Effective Defensible Space” for specific information.”**
CREATING AN EFFECTIVE DEFENSIBLE SPACE*
...A Step-by-Step Guide

Are you worried about the wildfire threat to your home, but aren’t sure how to get started in making your home defensible? Follow these six steps to an effective defensible space...

STEP ONE: HOW BIG IS AN EFFECTIVE DEFENSIBLE SPACE?

The size of the defensible space area is usually expressed as a distance extending outward from the sides of the house. This distance varies by the type of wildland vegetation growing near the house and the steepness of the terrain.

On the “Recommended Defensible Space Distance” chart presented below, find the vegetation type and percent slope (see “Homeowners Guide to Calculating Percent Slope”) which best describes the area where your house is located. Then find the recommended defensible space distance for your situation.

For example, if your property is surrounded by wildland grasses such as cheatgrass, and is located on flat land, your recommended defensible space distance would extend 30 feet from the sides of the house. If your house is on a 25% slope and the adjacent wildland vegetation is dense tall brush, your recommended defensible space distance would be 200 feet.

If the recommended distance goes beyond your property boundaries, contact the adjacent property owner and work cooperatively on creating a defensible space. The effectiveness of defensible space increases when multiple property owners work together. The local assessor’s office can provide assistance if the owners of adjacent properties are unknown. Do not work on someone else’s property without their permission.

Temporarily mark the recommended distance with flagging or strips of cloth tied to shrubs, trees, or stakes around your home. This will be your defensible space area.

---

STEP TWO: IS THERE ANY DEAD VEGETATION WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?

Dead vegetation includes dead trees and shrubs, dead branches lying on the ground or still attached to living plants, dried grass, flowers and weeds, dropped leaves and needles, and firewood stacks. In most instances, dead vegetation should be removed from the recommended defensible space area. A description of the types of dead vegetation you’re likely to encounter and the recommended actions are presented below on the next page.

---

VEGETATION TYPE

Wildland grasses (such as cheatgrass), weeds, and widely scattered shrubs with grass understory.

Shrubs

Includes shrub dominant areas.

Trees

Includes forested areas. If substantial grass or shrub understory is present, use those values shown above.

---

DEFENSIBLE SPACE RECOMMENDED DISTANCES—STEEPNESS OF SLOPE

<table>
<thead>
<tr>
<th>Vegetation Type</th>
<th>Flat to Gently Sloping (0 to 20%)</th>
<th>Moderately Steep (21% to 40%)</th>
<th>Very Steep (+40%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wildland grasses</td>
<td>30 feet</td>
<td>100 feet</td>
<td>100 feet</td>
</tr>
<tr>
<td>Shrubs</td>
<td>100 feet</td>
<td>200 feet</td>
<td>200 feet</td>
</tr>
<tr>
<td>Trees</td>
<td>30 feet</td>
<td>100 feet</td>
<td>200 feet</td>
</tr>
</tbody>
</table>

1) Find the percent slope which best describes your property.
2) Find the type of vegetation which best describes the wildland plants growing on or near your property.
3) Locate the number in feet corresponding to your slope and vegetation. This is your recommended defensible space distance.

*Please note the recommendations presented in this article are suggestions made by local firefighters experienced in protecting homes from wildfire. They are not requirements nor do they take precedence over local ordinances.
**STEP THREE: IS THERE A CONTINUOUS DENSE COVER OF SHRUBS OR TREES PRESENT WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?**

Sometimes wildland plants can occur as an uninterrupted layer of vegetation as opposed to being patchy or widely spaced individual plants. The more continuous and dense the vegetation, the greater the wildfire threat. If this situation is present within your defensible space area, you should “break-it-up” by providing a separation between plants or small groups of plants.

<table>
<thead>
<tr>
<th>TYPES OF DEAD VEGETATION AND RECOMMENDED PRACTICE</th>

</tr>
<tr>
<td><strong>DEAD NEEDLES, LEAVES, BRANCHES, AND TWIGS (OTHER THAN ON THE GROUND)</strong></td>
</tr>
<tr>
<td><strong>FIREWOOD AND OTHER COMBUSTIBLE DEBRIS</strong></td>
</tr>
</tbody>
</table>

Not only are steep slopes often considered high wildfire areas, they are also highly erodable. When removing shrubs and trees from steep slopes, keep soil disturbance to a minimum. Also, it may be necessary to replace flammable vegetation with other plant materials to prevent excessive soil erosion.

**Recommended Separation Distances for Shrubs and Small Conifers**

For areas with dense brush and small conifer trees, the recommended separation distance is dependant upon shrub height and steepness of slope. Specific recommendations are presented below:

- **Flat to Gently Sloping**
  - 0-20%
  - 2x

- **Moderately Steep**
  - 21-40%
  - 4x

- **Very Steep**
  - +40%
  - 6x

**Note:** Separation distances are measured between canopies (outermost branches) and not between trunks.

For example, if your home is located on a 10% slope and the brush is four feet tall, the separation distance would be two times the shrub height or eight feet. The recommended separation distance can be accomplished by removing plants or through pruning that reduces the diameter or height of shrubs (shorter height means less separation is needed). Removal works best for sagebrush. For shrubs which readily resprout, pruning to reduce height may be the best approach.
Note: Separation distances are measured between canopies (outer most branches) and not between trunks. For example, if your house is situated on a 30% slope, the separation of tree canopies within your defensible space should be 20 feet. Creating separation between tree canopies can be accomplished through tree removal.

**STEP FOUR: ARE THERE LADDER FUELS PRESENT WITHIN THE RECOMMENDED DEFENSIBLE SPACE AREA?**

Vegetation is often present at varying heights, similar to the rungs of a ladder. Under these conditions, flames from fuels burning at ground level, such as a thick layer of pine needles, can be carried to shrubs which can ignite still higher fuels like tree branches. Vegetation that allows a fire to move from lower growing plants to taller ones is referred to as “ladder fuel.” The ladder fuel problem can be corrected by providing a separation between the vegetation layers.

Within the defensible space area, a vertical separation of three times the height of the lower fuel layer is recommended. For example, if a shrub growing adjacent to a large pine tree is three feet tall, the recommended separation distance would be nine feet. This could be accomplished by removing the lower tree branches, reducing the height of the shrub, or both. The shrub could also be removed.
**THE LEAN, CLEAN, AND GREEN CHECKLIST**

- Emphasize the use of low growing herbaceous (non-woody) plants that are kept green during the fire season through irrigation if necessary. Herbaceous plants include lawn, clover, a variety of groundcovers, bedding plants, bulbs, perennial flowers, and conservation grasses.
- Emphasize use of mulches, rock, and non-combustible hard surfaces (concrete sidewalks, brick patios, and asphalt driveways).
- Deciduous ornamental trees and shrubs are acceptable if they are kept green and free of dead plant material, ladder fuels are removed, and individual plants or groups of plants are arranged so that adjacent wildland vegetation cannot convey a fire through them to the structure. Shorter deciduous shrubs are preferred.
- Minimize the use of ornamental coniferous shrubs and trees (such as juniper, arborvitae, and mugo pine) and tall exotic grasses (such as pampas grass).
- Where permitted, most wildland shrubs and trees should be removed from this zone and replaced with more desirable alternatives (see first box). Individual specimens or small groups of wildland shrubs and trees can be retained so long as they are kept healthy and free of dead wood, are pruned to reduce the amount of fuel and height, and ladder fuels are removed.
- For some areas substantial removal of wildland vegetation may not be allowed. In these instances, wildland vegetation should conform to the recommendations presented in steps 2 through 4. Please become familiar with local requirements before removal of wildland vegetation.
- Tree limbs within 15 feet of a chimney, encroaching on powerlines, or touching the house should be removed.
Lawn can be an effective landscape feature in advancing flames. Between zones creates breaks in the path to slow does accumulate dry, flammable material. The transition groundcovers keep fire near ground level. Native slow growth requires less frequent pruning.

**Zone 1: Moist and Trim**
Choose “firewise” plants. Low-growing, firewise plants resist catching fire and provide little fuel. Lawns, groundcovers, perennials and annuals form a greenbelt that is regularly watered and maintained to eliminate dry plant litter. Rock mulches, patios, masonry or rock planters are excellent fuel breaks. Be creative with boulders, riprap, and dry streambeds. This zone may contain occasional individual shrubs and trees located at least 10 feet from the house.

The traditional foundation planting of junipers is not a viable solution in a firescape design. Because junipers, other conifers and broadleaf evergreens contain oils, resins and waxes that make these plants burn with great intensity, use of these plants should be minimized within 30 feet of structure. A firescape landscape lets plants and garden elements reveal their innate beauty by leaving space between plants and groups of plants.

**Characteristics of Firewise Plants**
- Little seasonal accumulation of dead vegetation
- Open, loose branching habit
- Non-resinous woody material, avoid junipers and other conifers
- Low volume of total vegetation
- High moisture content in leaves
- Slow growth requires less frequent pruning

**Zone 2: Low and Sparse**
Slow growing, drought tolerant shrubs and groundcovers keep fire near ground level. Native vegetation can be retained here if it is low growing and does accumulate dry, flammable material. The transition between zones creates breaks in the path to slow advancing flames.

**Zone 3: High and Clean**
Fire intensity is reduced where it can burn less fuel. Native trees are thinned and dry debris on the ground is removed. Prune tree branches to 10’ or more above ground to reduce the possibility of surface fires spreading into tree crowns. This zone requires removing overgrowth and major pruning every three to five years. Specimen trees can be planted at the edge of this zone if pruned properly.

**Fire-Wise Plant Material for the Pacific Northwest**
Although there are no fire proof plant materials, the following is a list of some firewise plants that can be used in landscaping for fire prevention. Landscape maintenance is far more important to fire prevention than the selection of plant materials. When planning your landscape, use the characteristics of firewise-plants along with site characteristics such as slope, aspect, hardiness zone and amount of precipitation to choose plant material suitable for your site.

**TREES**
- Conifers:
  - Cryptomeria japonica: Japanese cedar
  - Pseudotsuga menziesii: Douglas fir
  - Tsuga heterophylla: Western hemlock

**SHRUBS**
- Amelanchier spp.: Serviceberry
- Arctostaphylos spp.: Bearberry
- Rhododendron spp.: Rhododendron
- Ribes spp.: Current
- Shepherdia argentea: Snowberry
- Viburnum trilobum: Cranberry bush
- Yucca spp.: Yucca

**PERENNIALS**
- Achillea millefolium: Yarrow
- Allium schoenoprasum: Chives
- Bergenia spp.: Bergenia
- Brodiaea spp.: Lilies
- Coreopsis spp.: Coreopsis
- Erysimum linifolium: Californian poppy
- Eschscholzia californica: Golden poppy
- Fragaria spp.: Wild strawberries
- Geranium spp.: Geranium
- Hemerocallis fulva: Daylilies
- Heuchera spp.: Coral bells
- Hosta spp.: Hosta
- Iris spp.: Iris
- Kniphofia uvaria: Red hot poker
- Lupinus spp.: Lupine
- Oenothera biennis: Evening primrose
- Penstemon spp.: Beard tongue
- Solidago spp.: Goldenrod
- Stachys byzantina: Lamb’s ear

**GROUNDCOVERS**
- Sedum spp.: Stonecrop
- Delosperma spp.: Hens & chicks
- Erica spp.: Heathers
- Echeveria spp.: Hens & chicks
- Echium plantagineum: Hare’s ear

**Succulents:**
- Aloe spp.: Aloes
- Aichryson monstrosum: Wild rosemary
- Duroia insignis: Hardest ice plant
- Delosperma bourgeonii: Desert rose
- Echeveria spp.: Hens & chicks
- Lithodora diffusa: Baby blue eyes

**Non-succulents:**
- Achillea millefolium: Yarrow
- Atriplex canescens: Four-wing saltbrush
- Berberis darwinii: Oregon grape
- Buddleia davidii: Butterfly bush
- Cornus alba: Dogwood
- Cotoneaster salicifolius: Cotoneaster
- Cotoneaster dammeri: Cotoneaster
- Euonymus fortunei: Euonymus
- Hypericum calycinum: St. John’s wort
- Potentilla reptans: Cinquefoil
- Senecio cineraria: Dusty miller
- Thymus vulgaris: Thyme
- Verbena bonariensis: Verbena
- Vinca minor: Periwinkle

**Regular Maintenance**
Experience and research has shown that a distance of 100-150 feet around your home needs this comprehensive landscaping. Greater distances are necessary on steep slopes or windswept exposures.

Most plants accumulate excess woody material and all shed seasonal foliage. Branches spread, often touching other vegetation. Weeds grow between landscape plants. You must actively reduce this accumulation of potential fuel by regular pruning, mowing and raking, followed by proper disposal. The less accumulated plant debris, the slower a fire will spread.
OTHER CONSIDERATIONS IN MAKING YOUR HOME SURVIVABLE

How a house is designed, where it is built, materials used in its construction and landscape, and access to the home all influence survivability during wildfire. Presented below are recommendations and an illustration modified from the publication “How to Make Your Home Fire Safe.” These recommendations will make a home much easier to defend and will improve its chances of surviving a wildfire.

1. ROOF

- Your roof is the most vulnerable part of your house in a wildfire. If you have a wood shake roof consider replacing it with class C or better fire resistant roofing.
- Remove dead branches hanging over your roof.
- Remove any branches within 15 feet of your chimney.
- Clean all dead leaves and needles from your roof and gutters.
- Cover your chimney outlet and stovepipe with a nonflammable screen of one-half inch or smaller mesh.

2. CONSTRUCTION

- Build your home away from ridge tops, canyons and areas between high points on a ridge.
- Build your home at least 30 feet from your property line.
- Box your eaves.
- Use fire resistant building materials.
- Enclose the underside of balconies and above-ground decks with fire resistant materials.
- Limit the size and number of windows in your home that face large areas of vegetation.
- Install only dual-paned or triple-paned windows.
- Consider sprinkler systems within the house. They may protect your home while you’re away or prevent a house fire from spreading into the wildlands.

3. LANDSCAPE

- See “Creating An Effective Defensible Space” and “Firescape - Fire Safe Landscape Design.”

4. YARD

- Stack woodpiles at least 30 feet from all structures and clear away flammable vegetation within 10 feet of woodpiles.
- Locate LPG tanks (butane and propane) at least 30 feet from any structure and surround them with 10 feet of clearance.
- Remove all stacks of construction materials, pine needles, leaves and other debris from your yard.
- Contact qualified individuals to perform electrical maintenance and repairs.
- Make sure that electric service lines, fuse boxes and circuit breaker panels are installed and maintained as prescribed by code.
- Post clear road signs to show traffic restrictions such as dead-end roads, and weight and height limitations.
- Make sure dead-end roads and long driveways have turnaround areas wide enough for emergency vehicles. Construct turnouts along one-way roads.
- Clear flammable vegetation at least 10 feet from roads and five feet from driveways.
- Cut back overhanging tree branches above roads.
- Construct fire barriers, such as greenbelts, parks, golf courses and athletic fields.
- Make sure that your street is named or numbered, and a sign is visibly posted at each street intersection.
- Post your house address at the beginning of your driveway, or on your house if it is easily visible from the road.
- If your water comes from a well, consider an emergency generator to operate the pump during a power failure.

6. ACCESS

- Identify at least two exit routes from your neighborhood.
- Construct roads that allow two way traffic.
- Design road width, grade and curves to allow access for large emergency vehicles.
- Construct driveways to allow large emergency equipment to reach your house.
- Design bridges to carry heavy emergency vehicles, including bulldozers carried on large trucks.

7. OUTSIDE

- Designate an emergency meeting place outside your home.
- Practice emergency exit drills regularly.
- Make sure that electric service lines, fuse boxes and circuit breaker panels are installed and maintained as prescribed by code.
- Contact qualified individuals to perform electrical maintenance and repairs.

FIRE BRANDS AND THE WOODSHAKE ROOF HAZARD

Firebrands are burning embers produced by wildfire which are lifted high into the air and carried beyond the fire front. Firebrands are one of the major causes of homes burned due to wildfire. Typical firebrand materials include pine cones, bark, and if houses are involved, wood shakes and shingles. Depending on wind speed and size of materials, firebrands can be carried more than one-half mile ahead of the fire front.

A shower of thousands of firebrands can be produced during a major wildfire event. If these firebrands land in areas with easily ignited fuels, numerous spot fires can start. Homes located blocks away from the main fire front can be threatened.

A house can be threatened by a wildfire in three ways: direct exposure from flames, radiated heat, and airborne firebrands. Of these, firebrands account for the majority of homes burned by wildfire. The roof of the house is the most vulnerable to firebrands.

Because of its angle, the roof can catch and trap firebrands. If the roof is constructed of combustible materials such as untreated wood shakes and shingles, the house is in jeopardy of igniting and burning.

Not only are combustible roofing materials a hazard to the structure on which they are installed, but they also pose a threat to other houses in the vicinity. Burning wood shakes can become firebrands, be lifted from the burning roof, and carried blocks away, and land in receptive fuel beds such as other combustible roofs.

Unfortunately for homeowners with existing combustible roofs, there are no long-term reliable measures available to reduce roof vulnerability to wildfire other than re-roofing with fire resistant materials.

*If connected to the house, i.e., fences and decks, consider it part of the house.
WHEN WILDFIRE APPROACHES

Should homes be threatened by wildfire, occupants may be advised to evacuate to protect them from life-threatening situations. Homeowners, however, do have the right to stay on their properties if they so desire and so long as their activities do not hinder fire fighting efforts. If occupants are not contacted in time to evacuate or if owners decide to stay with their homes, these suggestions will help them protect their properties and families.

- Evacuate, if possible, all family members not essential to protecting the house. Evacuate pets as well.
- Contact a friend or relative and relay your plans.
- Make sure family members are aware of a prearranged meeting place.
- Tune into a local radio station and listen for instructions.
- Place vehicles in the garage, have them pointing out, and roll up windows.
- Place valuable papers and momentos in the car.
- Place combustible patio furniture in the house or garage.
- Place garden hoses, fire extinguishers, and water in a readily accessible place.
- Prop a ladder against the house so firefighters have easy access.
- Tune into a local radio station and listen for instructions.
- Close the garage door, but leave it unlocked. If applicable, disconnect the electric garage door opener so that the door can be opened manually.
- Place combustible patio furniture in the house or garage.
- Shut off propane at the tank or natural gas at the meter.
- Wear only cotton or wool clothes. Proper attire includes long pants, long sleeved shirt or jacket, and boots. Carry gloves, a handkerchief to cover face, water to drink, and goggles.
- Close all exterior vents.
- Prop a ladder against the house so firefighters have easy access to the roof.
- Make sure that all garden hoses are connected to faucets and attach a nozzle set on "spray."
- Soak rags, towels, or small rugs with water to use in beating out embers or small fires.
- Inside, fill bathtubs, sinks, and other containers with water. Outside, do the same with garbage cans and buckets. Remember that the water heater and toilet tank are available sources of water.
- Close all exterior doors and windows.
- Close all interior doors.
- Open the fireplace damper, but place the screen over the hearth to prevent sparks and embers from entering the house.
- Leave a light on in each room.
- Remove lightweight and/or non-fire resistant curtains and other combustible materials from around windows.
- If available, close fire resistant drapes, shutters, or venetian blinds. Attach pre-cut plywood panels to the exterior of windows and glass doors.
- Turn off all pilot lights.
- Move overstuffed furniture (e.g. couches, easy chairs, etc.) to the center of the room.
- Keep wood shake or shingle roofs moist by spraying water. Do not waste water. Consider placing a lawn sprinkler on the roof if water pressure is adequate. Do not turn on until burning embers begin to fall on the roof.
- Continually check the roof and attic for embers, smoke, or fire.
- Close all interior doors.
- Place combustible patio furniture in the house or garage.
- Place garden hoses, fire extinguishers, and water in a readily accessible place.
- Prop a ladder against the house so firefighters have easy access to the roof.
- Make sure that all garden hoses are connected to faucets and attach a nozzle set on "spray."
- Soak rags, towels, or small rugs with water to use in beating out embers or small fires.

- Keep wood shake or shingle roofs moist by spraying water. Do not waste water. Consider placing a lawn sprinkler on the roof if water pressure is adequate. Do not turn on until burning embers begin to fall on the roof.
- Continually check the roof and attic for embers, smoke, or fire.

If a fire should occur within the house, contact the fire department immediately. Continue to inspect your house and property for embers and smoke.

Most importantly, STAY CALM!

In May of 1999, the University of Nevada, Reno (Cooperative Extension and Agricultural Experiment Station) and the Sierra Front Wildfire Cooperators initiated a program entitled Living With Fire. One of the products of the Living With Fire program was a publication for homeowners.

The Pacific Northwest Prevention Working Team for the Pacific Northwest Wildfire Coordinating Group reviewed and modified this publication for use throughout the Northwest.

For more information please contact your local fire service office.

Fire Drill

To find out if your home makes the grade, answer the following questions. Your goal is to make your home survive a wildfire, so be honest in evaluating your progress.

*True/False

- T F I have a minimum 30-foot non-combustible area around my home
- T F My landscaping includes fire-resistant varieties
- T F I have evaluated my wood shake roof for treatment or replacement
- T F Overcrowded or weakened trees have been thinned or removed from my property, and low-hanging branches have been pruned
- T F The grass and weeds are consistently cut
- T F My wood pile and left-over building materials are at least 30 feet from my house
- T F I’ve cleared needles, leaves and debris from my roof and deck
- T F Street signs and the address of my home are visible from the road
- T F I have an emergency checklist in the event of a wildfire, and I know to monitor local media for up-to-date information

*If you answered False to any of these questions, bone up on your efforts and try again! The more correct answers you give, the greater your chances of survival—and passing the ultimate test!
