Seismicity of the Earth 1900–2007
Japan and Vicinity

Compiled by Susan Rhea, Arthur C. Tan, Gavin Hayes, Antonio Villaseñor*, and Harley Benz

The map shows details of Japan and vicinity not visible in an earlier publication (Tarr and others, 2010). This map is produced for the Japan and vicinity seismicity presented on the main map. The plate boundaries (Bird, 2003) are known most accurately on the main map. The nucleation points of great earthquakes (M≥8.3) are designated with a label showing the year of determinations for the period 1964-2002 and a magnitude range of 5.0≤M≤5.4 (Engdahl, personal comm).
