

September 27, 1955

TO LEGAL COUNSEL:

We are enclosing herewith for insertion in Volume V, Cancer Theories Section, page 21, an article by Drs. Adams and Imagawa entitled, "Flu and Chemical Cause Lung Growth in Mice". You will note that in this article there is a suggested direct implication (by animal experiment), of influenza as one of the factors that must be considered in the rise in lung cancer.

Also enclosed is an article by Drs. Meyer and Benjafield, entitled "Carcinoma and Antibiotics", for insertion into Volume V, Cancer Theories, pages 22-23. This item is sent to you as a complete article because it is the first article which offers a complete and direct reference to an environmental factor which has affected the total population with a considered conclusion that the use of antibiotics might profoundly affect the incidence of lung cancer.

A. GRANT CLARKE
