Title: A Report on the Boreal Ecosystem-Atmosphere Study (BOREAS)

Editors: N. W. H. H. Still and Sara K. Conrad

NASA TGB-12 Isotropic Carbon Dioxide

Authors: E. Sundquist and G. Winston

NASA/Goddard Space Flight Center
Greenbelt, Maryland 20771

November 2000
Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the lead center for NASA’s scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA’s institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA’s counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.

- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.

- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.

- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and mission, often concerned with subjects having substantial public interest.

- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA’s mission.

Specialized services that complement the STI Program Office’s diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

For more information about the NASA STI Program Office, see the following:

November 2000
BOREAS TGB-12 Isotopic Carbon Dioxide Data over the NSA

Sue Trumbore, Eric Sundquist, Greg Winston

Summary

The BOREAS TGB-12 team made measurements of soil carbon inventories, carbon concentration in soil gases, and rates of soil respiration at several sites to estimate the rates of carbon accumulation and turnover in each of the major vegetation types. This data set contains information on the carbon isotopic content of carbon dioxide sampled from soils in the NSA-OBS, NSA-YJP, and NSA-OJP sites. Data were collected from 14-Nov-1993 to 10-Oct-1996. The data are stored in tabular ASCII files.

1. Data Set Overview

1.1 Data Set Identification

BOREAS TGB-12 Isotopic Carbon Dioxide Data over the NSA

1.2 Data Set Introduction

The data collected by the BOReal Ecosystem-Atmosphere Study (BOREAS) Trace Gas Biogeochemistry (TGB)-12 team include CO₂ flux rates and concentrations in the soil atmosphere at selected sites, as well as ^14C measurements of CO₂. Our measurements were designed to cover the winter period.
1.3 Objective/Purpose
The objectives were: To estimate rates of carbon input, turnover, and accumulation in the soils of each of the major vegetation types at the BOREAS study sites. The primary tool was the measure of \(^{14}\text{C}\) content in soils, litter, and soil atmospheres, and the measurement of CO\(_2\) emissions from the soil. To relate our estimates of dynamics of soil carbon to ecosystem models of the carbon cycle, to other measures of C cycling dynamics, to regional models of soil carbon accumulation, and to spatial and temporal models of soil moisture and drainage.

1.4 Summary of Parameters
\(^{14}\text{C}\) data are presented in Delta notation (the per mil difference in the ratio of \(^{14}\text{C}/^{12}\text{C}\) in the sample from that of an absolute standard - 1895 wood). We also express what fraction of the bulk soil was used for radiocarbon measurement - plant macrofossils, chemically extracted clay, etc.).

1.5 Discussion
Winter fluxes of CO\(_2\) are often assumed to be zero in northern environments. Our goal in this series of measurements was to quantify the importance of winter CO\(_2\) emissions to the annual carbon balance at the Northern Study Area (NSA) Young Jack Pine (YJP), Old Jack Pine (OJP), and Old Black Spruce (OBS) tower sites. In addition, radiocarbon measurements of \(^{14}\text{C}\) in CO\(_2\) were used to determine whether winter and summer respiration had different sources. Sites were the same ones used by TGB-01 and TGB-03 for studies of soil respiration during May to October.

The steady-state \(^{14}\text{C}\) content of the atmosphere is determined by the exchange of carbon in CO\(_2\) with that in ocean and biospheric reservoirs. Because of the relatively rapid cycling of carbon between the atmosphere and living biomass, most short-lived plant tissues maintain a \(^{14}\text{C}\) specific activity that equals that of atmospheric CO\(_2\). CO\(_2\) derived from old organic matter that has resided in soils for several hundred years will have lower radiocarbon content than that derived from more recently fixed carbon.

2. Investigator(s)

2.1 Investigator(s) Name and Title
Susan Trumbore
Earth System Science
University of California Irvine

2.2 Title of Investigation
Input, Accumulation and Turnover of Carbon in Boreal Forest Soils
3. Theory of Measurements

Soil fluxes were measured using chamber methods, which involve enclosing the airspace over soil and monitoring the mixing ratio of gases within the chamber over time. For radiocarbon, we needed to trap the CO$_2$ out of the chamber headspace to collect enough carbon for the $^{14}$C measurement. Specifics are given in Winston et al. (1997) and Section 4, below.

Measurements of soil gas concentrations may be combined with estimates of the rate of diffusion in soils to determine the contribution to surface CO$_2$ emissions derived from various soil depths (see Davidson and Trumbore, 1995, for an example). To do this in BOREAS, we measured CO$_2$, temperature, and moisture profiles, as well as $^{222}$Rn for estimating soil diffusivity. Special pits were instrumented with thermistors (for monitoring soil temperature), Time Domain Reflectometry (TDR) probes (for monitoring soil water content), and soil gas probes (1/8" stainless steel tubing, perforated at one end and inserted 50 to 100 cm laterally into the soil pit wall, capped with 1/8" swagelock union fittings sealed with a septum). Further details are given in Winston et al. (1997) and in Section 4, below.
Calculation of a radiocarbon age requires the assumption that the $^{14}$C content of the carbon originally fixed in plant tissues equaled that of the atmospheric CO$_2$ in 1950 (0.95 times the activity of oxalic acid, or Modern). In fact, the $^{14}$C content of the atmosphere has varied with time because of changes in the production rate of $^{14}$C (cosmic ray flux and magnetic field variations) and because of changes in the distribution of carbon among ocean, biosphere, and atmospheric reservoirs. These variations, deduced from the $^{14}$C content of cellulose of known age taken from the annual growth rings of trees, are generally less than 10% over the past 7,000 years. More recent changes in the $^{14}$C content of atmospheric CO$_2$ have resulted from dilution by $^{14}$C-free fossil-fuel-derived carbon and by the production of $^{14}$C during atmospheric testing of thermonuclear weapons (bomb $^{14}$C). The latter effect dominates other natural and fossil fuel effects, as the atmospheric burden of $^{14}$C was approximately doubled in the few years preceding the implementation of the Nuclear Test Ban Treaty in 1964. This isotopic spike in the global carbon system provides a means for radiocarbon to be a useful tracer of carbon cycle processes on the scale of decades.

We express $^{14}$C data in the geochemical Delta notation, the deviation in parts per thousand (per mil) from an absolute standard (95 times the activity of NBS oxalic acid measured in 1950). In this notation, zero equals the $^{14}$C content of 1895 wood, positive values indicate the presence of 'bomb' radiocarbon, and negative values indicate the predominance of C fixed from the atmosphere more than several hundred years ago.

For seeds, deciduous leaves, etc., that represent a single year's growth, the $^{14}$C content of recent samples may be used to determine the age of a sample to within a year or two (for samples in the 'bomb' period, <30 years old). The $^{14}$C content of the sample is compared to the $^{14}$C record of atmospheric C in the Northern Hemisphere (see Burcholadze reference, below, as an example). Evergreen needles, that may average several years' growth, will have higher $^{14}$C signatures than deciduous leaves that grew since 1964.

For samples prior to 1960, radiocarbon ages in years may be calculated from the given Delta values as $-8033\times(\ln(\Delta \times 9.995/1000 + 1))$. The conventional radiocarbon age must be converted to a calibrated age using the tree-ring-based calibration curves, which correct for known variations in atmospheric $^{14}$C over time. Both ages are usually rounded to the nearest decade or pentade.

One application of radiocarbon to soil science lies in the relatively straightforward $^{14}$C dating of charcoal and plant macrofossils to determine the accumulation rate of C in vertically aggrading soils (like peats, or moss layers). Unlike the closed systems represented by intact macrofossils, such as seeds or pollen, bulk soil organic matter is a heterogeneous reservoir with a variety of turnover times, to which carbon is continuously added (as new plant matter) and lost (as leached organic carbon or CO$_2$). The radiocarbon content of soil organic matter cannot be interpreted as a 'date,' but represents the average age of a carbon atom in this reservoir.

The breakdown of C into faster- and slower-cycling pools may be determined by combining several approaches; see the articles in Section 17 for more information (this is an evolving research field and no one approach is accepted as valid for all soils).

4. Equipment

4.1 Sensor/Instrument Description

Because all of the equipment used in this project is common to many other projects and no special procedures were used, description detail has been minimized in this section, and the reader is referred to the appropriate publications.

- Davidson and Trumbore, 1995
- Stephens and Sundquist, 1998
- Trumbore and Harden, 1997
- Winston et al., 1997
- Harden et al., 1997
Flux chambers were used to measure CO₂ fluxes and to collect CO₂ for radiocarbon measurements. See Stephens and Sundquist (1998) and Winston et al (1997) for details. Stainless steel (1/8 inch) probes were used to collect soil atmosphere samples from different depths. Samples for CO₂ concentration measurement were removed by syringe; larger volume samples for ¹⁴C determination were collected by attaching pre-evacuated, electropolished, stainless steel cans of 500cc volume.

Lab Equipment - Carlo Erba NA1500 carbon and nitrogen combustion analyzer; vacuum lines for purification of CO₂ from combusted samples and graphite target preparation. The accelerator mass spectrometer (AMS) used for ¹⁴C measurement is described in Southon et al. (1992) and Trumbore (1998).

¹⁴CO₂ efflux from soil: Samples for ¹⁴C measurement of total soil respiration are collected from the headspace of a dynamic chamber using molecular sieve 13X traps. First, atmospheric CO₂ trapped during chamber emplacement is removed by circulating headspace air at flow rates of ~500 cm³/min through a soda lime column. Scrubbing continues until the equivalent of two chamber volumes has been passed over the soda lime. The molecular sieve trap then replaces the soda lime scrubber and CO₂ is trapped from circulating chamber air until enough has been collected for isotopic (¹³C and ¹⁴C) measurements. Trapping times vary from about 10 minutes to an hour, depending on the soil CO₂ emission rate. CO₂ is released from the trap at 500 °C, and purified cryogenically. One aliquot of the sample is measured for ¹³C content by stable isotope mass spectrometry. A second aliquot is reduced to graphite for ¹⁴C measurement by AMS. Comparison of ¹³C data for ambient air (sampled at the same site) with the ¹³C content of soil organic matter is used to correct the ¹⁴C data for small amounts of ambient air remaining in the sample.

4.1.1 Collection Environment
Samples were collected mostly in over two winters, though summer measurements were also made for isotopes.

4.1.2 Source/Platform
Ground.

4.1.3 Source/Platform Mission Objectives
None given.

4.1.4 Key Variables
The key variables are the CO₂ concentration, CO₂ flux and del ¹⁴C of CO₂.

4.1.5 Principles of Operation
None given.

4.1.6 Sensor/Instrument Measurement Geometry
None given.

4.1.7 Manufacturer of Sensor/Instrument
A LI-COR CO₂ analyzer was used to measure CO₂ fluxes in the field. The gas chromatography system described by TGB-01 (Crill) was used to determine CO₂ concentrations in soil air.

4.2 Calibration

4.2.1 Specifications
See Winston et al., 1997.

4.2.1.1 Tolerance
See Winston et al., 1997.
4.2.2 Frequency of Calibration
See Winston et al., 1997.

4.2.3 Other Calibration Information
See Winston et al., 1997.

5. Data Acquisition Methods

$^{14}$C. Carbon-14 is measured by accelerator mass spectrometry of graphite targets prepared from CO$_2$ (see one of several references, including Trumbore, 1995). Samples (of 1-2 mg carbon equivalent) are combusted in vacuum in quartz tubes with cupric oxide wire at 900 °C. The resulting CO$_2$ is purified cryogenically, then reduced to graphite coating cobalt powder in a sealed Pyrex tube at 500-550 °C with zinc and titanium hydride powder. AMS measurements were made at the Lawrence Livermore National Laboratory Center for Accelerator Mass Spectrometry. One sigma precision is usually +/- 8-10 per mil (0.8-1.0 % Modern) and overall accuracy (based on repeated measurements of substandards prepared in the same way as samples) is 1.0-1.5% of Modern (10-15 per mil).

6. Observations

6.1 Data Notes
None given.

6.2 Field Notes
None given.

7. Data Description

7.1 Spatial Characteristics

7.1.1 Spatial Coverage
The North American Datum of 1983 (NAD83) coordinates for the sites are:

<table>
<thead>
<tr>
<th>Site</th>
<th>Latitude</th>
<th>Longitude</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSA-OBS</td>

7.1.2 Spatial Coverage Map
Not applicable

7.1.3 Spatial Resolution
These data are point measurements at the given locations.

7.1.4 Projection
Not applicable.

7.1.5 Grid Description
Not applicable
7.2 Temporal Characteristics

7.2.1 Temporal Coverage
The data were collected over the period of 14-Nov-1993 to 10-Oct-1996. Data collection was not continuous; most CO₂ fluxes were measured in winter.

7.2.2 Temporal Coverage Map
None.

7.2.3 Temporal Resolution
None given.

7.3 Data Characteristics

7.3.1 Parameter/Variable
The parameters contained in the data files on the CD-ROM are:

<table>

### 8. Data Organization

#### 8.1 Data Granularity

The smallest unit of data tracked by the BOREAS Information System (BORIS) was the CO2 flux measured for a given site on a given day.

#### 8.2 Data Format(s)

The Compact Disk-Read-Only Memory (CD-ROM) files contain American Standard Code for Information Interchange (ASCII) numerical and character fields of varying length separated by commas. The character fields are enclosed with single apostrophe marks. There are no spaces between the fields.

Each data file on the CD-ROM has four header lines of Hyper-Text Markup Language (HTML) code at the top. When viewed with a Web browser, this code displays header information (data set title, location, date, acknowledgments, etc.) and a series of HTML links to associated data files and related data sets. Line 5 of each data file is a list of the column names, and line 6 and following lines contain the actual data.
9. Data Manipulations

9.1 Formulae
None given.

9.1.1 Derivation Techniques and Algorithms
None.

9.2 Data Processing Sequence
None given.

9.2.1 Processing Steps
None given.

9.2.2 Processing Changes
None given.

9.3 Calculations
None given.

9.3.1 Special Corrections/Adjustments
None given.

9.3.2 Calculated Variables
None.

9.4 Graphs and Plots
None.

10. Errors

10.1 Sources of Error
We have assumed -25 per mil $^{13}\text{C}$ in correcting $^{14}\text{C}$ data for fractionation (error of 2 per mil in this term leads to a 4 per mil error in Del $^{14}\text{C}$ -- as long as vegetation is predominantly C3 photosynthetic pathway, this is not a large contributing error in $^{14}\text{C}$ analyses).

10.2 Quality Assessment

10.2.1 Data Validation by Source
None given.

10.2.2 Confidence Level/Accuracy Judgment
None given.

10.2.3 Measurement Error for Parameters
None given.

10.2.4 Additional Quality Assessments
None given.

10.2.5 Data Verification by Data Center
Data were examined for general consistency and clarity.
11. Notes

11.1 Limitations of the Data
None given.

11.2 Known Problems with the Data
None given.

11.3 Usage Guidance
None given.

11.4 Other Relevant Information
None.

12. Application of the Data Set

One application of radiocarbon to soil science lies in the relatively straightforward $^{14}$C dating of charcoal and plant macrofossils to determine the accumulation rate of C in vertically aggrading soils (like peats, or moss layers). Unlike the closed systems represented by intact macrofossils, such as seeds or pollen, bulk soil organic matter is a heterogeneous reservoir with a variety of turnover times, to which carbon is continuously added (as new plant matter) and lost (as leached organic carbon or CO$_2$). The radiocarbon content of soil organic matter cannot be interpreted as a 'date,' but represents the average age of a carbon atom in this reservoir. As such, dating various layers in the soil can give modelers information about the carbon accumulation and release rates over time and potentially relate this to climate changes and effects.

13. Future Modifications and Plans

The data will be published as a USGS open file report in the future.

14. Software

14.1 Software Description
None given.

14.2 Software Access
None given.

15. Data Access

The TGB-12 isotopic carbon dioxide data are available from the Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAAC).
15.1 Contact Information
For BOREAS data and documentation please contact:

ORNL DAAC User Services
Oak Ridge National Laboratory
P.O. Box 2008 MS-6407
Oak Ridge, TN 37831-6407
Phone: (423) 241-3952
Fax: (423) 574-4665
E-mail: ornldaac@ornl.gov or ornl@eos.nasa.gov

15.2 Data Center Identification
Earth Observing System Data and Information System (EOSDIS) Oak Ridge National Laboratory (ORNL) Distributed Active Archive Center (DAAC) for Biogeochemical Dynamics

15.3 Procedures for Obtaining Data
Users may obtain data directly through the ORNL DAAC online search and order system [http://www-eosdis.ornl.gov/] and the anonymous FTP site [ftp://www-eosdis.ornl.gov/data/] or by contacting User Services by electronic mail, telephone, fax, letter, or personal visit using the contact information in Section 15.1.

15.4 Data Center Status/Plans
The ORNL DAAC is the primary source for BOREAS field measurement, image, GIS, and hardcopy data products. The BOREAS CD-ROM and data referenced or listed in inventories on the CD-ROM are available from the ORNL DAAC.

16. Output Products and Availability

16.1 Tape Products
None.

16.2 Film Products
None.

16.3 Other Products
These data are available on the BOREAS CD-ROM series.

17. References

17.1 Platform/Sensor/Instrument/Data Processing Documentation
None given.

17.2 Journal Articles and Study Reports

17.3 Archive/DBMS Usage Documentation
None.

18. Glossary of Terms
None given.

19. List of Acronyms

AMS - Accelerator Mass Spectrometer
ASCII - American Standard Code for Information Interchange
BOREAS - BOReal Ecosystem-Atmosphere Study
BORIS - BOREAS Information System
CD-ROM - Compact Disk-Read-Only Memory
DAAC - Distributed Active Archive Center
EOS - Earth Observing System
EOSDIS - EOS Data and Information Archive System
GIS - Geographic Information System
GSFC - Goddard Space Flight Center
HTML - Hyper-Text Markup Language
MSA - Modeling Sub-Area
NAD83 - North American Datum of 1983
NASA - National Aeronautics and Space Administration
NSA - Northern Study Area
OA - Old Aspen
OBS - Old Black Spruce
OJP - Old Jack Pine
ORNL - Oak Ridge National Laboratory
PANP - Prince Albert National Park
SSA - Southern Study Area
TDR - Time Domain Reflectometry
TE - Terrestrial Ecology
TGB - Trace Gas Biogeochemistry
URL - Uniform Resource Locator
USGS - United States Geological Survey
YJP - Young Jack Pine

The BOREAS TGB-12 team made measurements of soil carbon inventories, carbon concentration in soil gases, and rates of soil respiration at several sites to estimate the rates of carbon accumulation and turnover in each of the major vegetation types. This data set contains information on the carbon isotopic content of carbon dioxide sampled from soils in the NSA-OBS, NSA-YJP, and NSA-OJP sites. Data were collected from 14-Nov-1993 to 10-Oct-1996. The data are stored in tabular ASCII files.
